

The package **piton**^{*}

F. Pantigny
fpantigny@wanadoo.fr

May 12, 2024

Abstract

The package **piton** provides tools to typeset computer listings, with syntactic highlighting, by using the Lua library LPEG. It requires LuaLaTeX.

1 Presentation

The package **piton** uses the Lua library LPEG¹ for parsing informatic listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with **lualatex** only (and won't work with the other engines: **latex**, **pdflatex** and **xelatex**). It does not use external program and the compilation does not require **--shell-escape**. The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by **piton**, with the environment **{Piton}**.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
    (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

The main alternatives to the package **piton** are probably the packages **listings** and **minted**.

The name of this extension (**piton**) has been choosen arbitrarily by reference to the pitons used by the climbers in alpinism.

^{*}This document corresponds to the version 3.0a of **piton**, at the date of 2024/05/12.

¹LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

²This LaTeX escape has been done by beginning the comment by **#>**.

2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

3 Use of the package

The package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

If, at the end of the preamble, the package `xcolor` has not been loaded (by the final user or by another package), `piton` loads `xcolor` with the instruction `\usepackage{xcolor}` (that is to say without any option). The package `piton` doesn't load any other package. It does not any exterior program.

3.2 Choice of the computer language

The package `piton` supports two kinds of languages:

- the languages natively supported by `piton`, which are Python, OCaml, C (in fact C++), SQL and a language called `minimal`³;
- the languages defined by the final user by using the built-in command `\NewPitonLanguage` described p. 9 (the parsers of those languages can't be as precise as those of the native languages supported by `piton`).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language`: `\PitonOptions{language = OCaml}`.

In fact, for `piton`, the names of the informatic languages are always **case-insensitive**. In this example, we might have written `Ocaml` or `ocaml`.

For the developpers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

3.3 The tools provided to the user

The package `piton` provides several tools to typeset Python codes: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}    def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.

³That language `minimal` may be used to format pseudo-codes: cf. p. 29

- The command `\PitonInputFile` is used to insert and typeset a external file.

It's possible to insert only a part of the file: cf. part 6.2, p. 12.

The key `path` of the command `\PitonOptions` specifies a *list* of pathes where the files included by `\PitonInputFile` will be searched. That list is comma separated.

The extension `piton` also provides the commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF` with supplementary arguments corresponding to the letters T and F. Those arguments will be executed if the file to include has been found (letter T) or not found (letter F).

3.4 The syntax of the command `\piton`

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- **Syntax `\piton{...}`**

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),
but the command `_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,
but the command `\%` is provided to insert a `%`;
- the braces must be appear by pairs correctly nested
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands⁴ are fully expanded and not executed,
so it's possible to use `\\"` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

```
\piton{MyString = '\\n'}
\piton{def even(n): return n%2==0}
\piton{c="#"      # an affectation }
\piton{c="#" \ \ \ # an affectation }
\piton{MyDict = {'a': 3, 'b': 4 }}
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4 }
```

It's possible to use the command `\piton` in the arguments of a LaTeX command.⁵

- **Syntaxe `\piton|...|`**

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

```
\piton|MyString = '\n'|
\piton!def even(n): return n%2==0!
\piton+c="#"      # an affectation +
\piton?MyDict = {'a': 3, 'b': 4}?
```

```
MyString = '\n'
def even(n): return n%2==0
c="#"      # an affectation
MyDict = {'a': 3, 'b': 4}
```

⁴That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

⁵For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

4 Customization

With regard to the font used by `piton` in its listings, it's only the current monospaced font. The package `piton` merely uses internally the standard LaTeX command `\texttt{}`.

4.1 The keys of the command `\PitonOptions`

The command `\PitonOptions` takes in as argument a comma-separated list of `key=value` pairs. The scope of the settings done by that command is the current TeX group.⁶

These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). Five values are allowed : Python, OCaml, C, SQL and minimal. The initial value is Python.
- The key `path` specifies a path where the files included by `\PitonInputFile` will be searched.
- The key `gobble` takes in as value a positive integer n : the first n characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value n of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n .
- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number n of spaces on that line and applies `gobble` with that value of n . The name of that key comes from *environment gobble*: the effect of `gobble` is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `write` takes in as argument a name of file (with its extension) and write the content⁷ of the current environment in that file. At the first use of a file by `piton`, it is erased.
- The key `path-write` specifies a path where the files written by the key `write` will be written.
- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).⁸
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.⁹
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 6.2, p. 12). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.
- The key `line-numbers/start` requires that the line numbering begins to the value of the key.

⁶We remind that a LaTeX environment is, in particular, a TeX group.

⁷In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 7, p. 20).

⁸For the language Python, the empty lines in the docstrings are taken into account (by design).

⁹When the key `split-on-empty-lines` is in force, the labels of the empty are never printed.

- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is 0.7 em.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
    line-numbers =
    {
        skip-empty-lines = false ,
        label-empty-lines = false ,
        sep = 1 em
    }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 8.1 on page 21.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

Example : `\PitonOptions{background-color = {gray!5,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

- With the key `prompt-background-color`, `piton` adds a color background to the lines beginning with the prompt “`>>>`” (and its continuation “`...`”) characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. 6.1.2, p. 11).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special value `min` requires two compilations with LuaLaTeX¹⁰.

For an example of use of `width=min`, see the section 8.2, p. 21.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters¹¹ are replaced by the character `□` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.¹²

Example : `my_string = 'Very□good□answer'`

¹⁰The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `latextmk` (used by Overleaf) do automatically a sufficient number of compilations.

¹¹With the language Python that feature applies only to the short strings (delimited by ' or "). In OCaml, that feature does not apply to the *quoted strings*.

¹²The package `piton` simply uses the current monospaced font. The best way to change that font is to use the command `\setmonofont` of the package `fontspec`.

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`¹³ is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by piton. The tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C,line-numbers,auto-gobble,background-color = gray!15]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
\end{Piton}

1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }
```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 10).

4.2 The styles

4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the Python listings. The customizations done by that command are limited to the current TeX group.¹⁴

The command `\SetPitonStyle` takes in as argument a comma-separated list of `key=value` pairs. The keys are names of styles and the value are LaTeX formatting instructions.

¹³cf. 6.1.2 p. 11

¹⁴We remind that a LaTeX environment is, in particular, a TeX group.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It's also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `lua-ul` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!50] }
```

In that example, `\highLight[red!50]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!50]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by `piton` in the different languages which it supports (Python, OCaml, C, SQL and “minimal”), are described in the part 9, starting at the page 25.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it's possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word **function** formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style *style*.

4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc. or a language defined by the command `\NewPitonLanguage`).

But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.¹⁵

For example, with the command

```
\SetPitonStyle[SQL]{Keywords = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of *group* in TeX).¹⁶

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

¹⁵We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

¹⁶As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

4.2.3 The style UserFunction

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style is empty, and, therefore, the names of the functions are formatted as standard text (in black). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

```
\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color[HTML]{CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}

\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}

def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for i in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

(Some PDF viewers display a frame around the clickable word `transpose` but others do not.)

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.¹⁷

4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.¹⁸

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{\begin{tcolorbox}}{\end{tcolorbox}}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

```
\NewPitonEnvironment{Python}{}
  {\begin{tcolorbox}}
  {\end{tcolorbox}}
```

¹⁷We remind that, in `piton`, the name of the informatic languages are case-insensitive.

¹⁸However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed.

With this new environment `{Python}`, it's possible to write:

```
\begin{Python}
def square(x):
    """Compute the square of a number"""
    return x*x
\end{Python}
```

```
def square(x):
    """Compute the square of a number"""
    return x*x
```

5 Definition of new languages with the syntax of listings

New 3.0

The package `listings` is a famous LaTeX package to format informatic listings.

That package provides a command `\lstdefinelanguage` which allows the user to define new languages. That command is also used by `listings` itself to provide the definition of the predefined languages in `listings` (in fact, for this task, `listings` uses a command called `\lst@definelanguage` but that command has the same syntax as `\lstdefinelanguage`).

The package `piton` provides a command `\NewPitonLanguage` to define new languages (available in `\piton`, `{Piton}`, etc.) with a syntax which is almost the same as the syntax of `\lstdefinelanguage`. Let's precise that `piton` does *not* use that command to define the languages provided natively (Python, OCaml, C++, SQL and `minimal`), which allows more powerful parsers.

For example, in the file `lstlang1.sty`, which is one of the definition files of `listings`, we find the following instructions (in version 1.10a).

```
\lstdefinelanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto;if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{*/},%
  morestring=[b]",%
  morestring=[b]',%
} [keywords,comments,strings]
```

In order to define a language called `Java` for `piton`, one has only to write the following code **where the last argument of `\lst@definelanguage`, between square brackets, has been discarded** (in fact, the symbols `%` may be deleted without any problem).

```
\NewPitonLanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
  const,continue,default,do,double,else,extends,false,final,%
  finally,float,for,goto;if,implements,import,instanceof,int,%
  interface,label,long,native,new,null,package,private,protected,%
  public,return,short,static,super,switch,synchronized,this,throw,%
  throws,transient,true,try,void,volatile,while},%
  sensitive,%
  morecomment=[1]//,%
  morecomment=[s]{/*}{*/},%
  morestring=[b]",%
  morestring=[b]',%
}
```

It's possible to use the language Java like any other language defined by piton.

Here is an example of code formatted in an environment {Piton} with the key `language=Java`.¹⁹

```
public class Cipher { // Caesar cipher
    public static void main(String[] args) {
        String str = "The quick brown fox Jumped over the lazy Dog";
        System.out.println( Cipher.encode( str, 12 ) );
        System.out.println( Cipher.decode( Cipher.encode( str, 12 ), 12 ) );
    }

    public static String decode(String enc, int offset) {
        return encode(enc, 26-offset);
    }

    public static String encode(String enc, int offset) {
        offset = offset % 26 + 26;
        StringBuilder encoded = new StringBuilder();
        for (char i : enc.toCharArray()) {
            if (Character.isLetter(i)) {
                if (Character.isUpperCase(i)) {
                    encoded.append((char) ('A' + (i - 'A' + offset) % 26));
                } else {
                    encoded.append((char) ('a' + (i - 'a' + offset) % 26));
                }
            } else {
                encoded.append(i);
            }
        }
        return encoded.toString();
    }
}
```

The keys of the command `\lstdefinelanguage` of `listings` supported by `\NewPitonLanguage` are: `morekeywords`, `otherkeywords`, `sensitive`, `keywordsprefix`, `moretexcs`, `morestring` (with the letters `b`, `d`, `s` and `m`), `morecomment` (with the letters `i`, `l`, `s` and `n`), `moredelim` (with the letters `i`, `l`, `s`, `*` and `**`), `moredirective`, `tag`, `alsodigit` and `alsoletter`.

For the description of those keys, we redirect the reader to the documentation of the package `listings` (type `texdoc listings` in a terminal).

6 Advanced features

6.1 Page breaks and line breaks

6.1.1 Page breaks

By default, the listings produced by the environment {Piton} and the command `\PitonInputFile` are not breakable.

However, the command `\PitonOptions` provides the keys `split-on-empty-lines` and `splittable` to allow such breaks.

- The key `split-on-empty-lines` allows breaks on the empty lines²⁰ in the listing. In the informatic listings, the empty lines usually separate the definitions of the informatic functions and it's pertinent to allow breaks between these functions.

In fact, when the key `split-on-empty-lines` is in force, the work goes a little further than merely allowing page breaks: several successive empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`. The initial value of this

¹⁹We recall that, for piton, the names of the informatic languages are case-insensitive. Hence, it's possible to write, for instance, `language=java`.

²⁰The “empty lines” are the lines which contains only spaces.

parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break).

- Of course, the key `split-on-empty-lines` may not be sufficient and that's why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value n (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the n first lines of the listing or within the n last lines. For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it's probably not recommandable).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.²¹

6.1.2 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces in the Python strings).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return.
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+ \;` (the command `\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$\hookrightarrow \;`.

The following code has been composed with the following tuning:

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}

    def dict_of_list(l):
        """Converts a list of subrs and descriptions of glyphs in \
+           ↪ a dictionary"""
        our_dict = {}
        for list_letter in l:
```

²¹With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

```

        if (list_letter[0][0:3] == 'dup'): # if it's a subr
            name = list_letter[0][4:-3]
            print("We treat the subr of number " + name)
        else:
            name = list_letter[0][1:-3] # if it's a glyph
            print("We treat the glyph of number " + name)
    our_dict[name] = [treat_Postscript_line(k) for k in \
+           ↪ list_letter[1:-1]]
    return dict

```

6.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formating) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

6.2.1 With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

6.2.2 With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programmation on the following model.

```

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>

```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in piton, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the beginning marker (in the example `# [Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which is the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}

def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-lines` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}

#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
    return v
#<Exercise 1>
```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

6.3 Highlighting some identifiers

The command `\SetPitonIdentifier` allows to change the formatting of some identifiers.

That command takes in three arguments:

- The optional argument (within square brackets) specifies the informatic language. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the informatic languages of `piton`.²²
- The first mandatory argument is a comma-separated list of names of identifiers.

²²We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf 4.2 p. 6).

Caution: Only the identifiers may be concerned by that key. The keywords and the built-in functions won’t be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```
\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}

def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
```

By using the command `\SetPitonIdentifier`, it’s possible to add other built-in functions (or other new keywords, etc.) that will be detected by `piton`.

```
\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
```

6.4 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It’s possible to compose comments entirely in LaTeX.
- It’s possible to have the elements between \$ in the comments composed in LaTeX mathematical mode.

- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the key `detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `\{Piton\}` many commands and environments of Beamer: cf. 6.5 p. 18.

6.4.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There are two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choose the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It's possible to change the formatting of the LaTeX comment itself by changing the `piton` style `Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use set `Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part 8.2 p. 21

If the user has required line numbers (with the key `line-numbers`), it's possible to refer to a number of line with the command `\label` used in a LaTeX comment.²³

6.4.2 The key “math-comments”

It's possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, *which is available only in the preamble of the document*.

Here is an example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute $x^2$
\end{Piton}

def square(x):
    return x*x # compute  $x^2$ 
```

²³That feature is implemented by using a redefinition of the standard command `\label` in the environments `\{Piton\}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

6.4.3 The key “detected-commands”

The key `detected-commands` of `\PitonOptions` allows to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).
- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must appear explicitly in the informative listing).

We assume that the preamble of the LaTeX document contains the following line.

```
\PitonOptions{detected-commands = highLight}
```

Then, it's possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highLight{return n*fact(n-1)}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

6.4.4 The mechanism “escape”

It's also possible to overwrite the Python listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it's necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, *available only in the preamble of the document*.

We consider once again the previous example of a recursive programmation of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `lua-ul`, we can use the syntax `\highLight[LightPink]{...}`. Because of the optional argument between square brackets, it's not possible to use the key `detected-commands` but it's possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!, end-escape=!}
```

Then, it's possible to write:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highLight[LightPink]{!return n*fact(n-1)!}!
\end{Piton}
```

```

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)

```

Caution : The escape to LaTeX allowed by the `begin-escape` and `end-escape` is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with #>; such comments are merely called “LaTeX comments” in this document).

6.4.5 The mechanism “escape-math”

The mechanism “`escape-math`” is very similar to the mechanism “`escape`” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “`escape-math`” is in fact rather different from that of the mechanism “`escape`”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and therefore, they can't be used to change the formatting of other lexical units.

In the languages where the character \$ does not play a important role, it's possible to activate that mechanism “`escape-math`” with the character \$:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Remark that the character \$ must *not* be protected by a backslash.

However, it's probably more prudent to use \(`` et ``\).

```
\PitonOptions{begin-escape-math=\(`,end-escape-math=\)`}
```

Here is an example of utilisation.

```

\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \(x < 0\) :
        return \(-\arctan(-x)\)
    elif \(x > 1\) :
        return \(\pi/2 - \arctan(1/x)\)
    else:
        s = \(0\)
        for \(k\) in range(\(n\)): s += \(\smash{\frac{(-1)^k}{2k+1}} x^{2k+1}\)
    return s
\end{Piton}

```

```

1 def arctan(x,n=10):
2     if x < 0 :
3         return - arctan(-x)
4     elif x > 1 :
5         return pi/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s += (-1)^k / (2k+1) * x^(2k+1)
9         return s

```

6.5 Behaviour in the class Beamer

First remark

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.²⁴

When the package `piton` is used within the class `beamer`²⁵, the behaviour of `piton` is slightly modified, as described now.

6.5.1 `{Piton}` et `\PitonInputFile` are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

6.5.2 Commands of Beamer allowed in `{Piton}` and `\PitonInputFile`

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

- no mandatory argument : `\pause`²⁶ ;
- one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ;
- two mandatory arguments : `\alt` ;
- three mandatory arguments : `\temporal`.

In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings²⁷ of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
```

²⁴Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

²⁵The extension `piton` detects the class `beamer` and the package `beamerarticle` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

²⁶One should remark that it's also possible to use the command `\pause` in a “LaTeX comment”, that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

²⁷The short strings of Python are the strings delimited by characters ' or the characters " and not ''' nor """. In Python, the short strings can't extend on several lines.

```

\only<3->{for x in l[1:]: s = s + "," + str(x)}
\only<4->{s = s + "}"}
return s
\end{Piton}
\end{frame}
\end{document}

```

In the previous example, the braces in the Python strings "{" and "}" are correctly interpreted (without any escape character).

6.5.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following environments of Beamer are directly detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`): `{actionenv}`, `{alertenv}`, `{invisibleenv}`, `{onlyenv}`, `{uncoverenv}` and `{visibleenv}`.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body.

Here is an example:

```

\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
    \begin{uncoverenv}<2>
        return x*x
    \end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}

```

Remark concerning the command \alert and the environment {alertenv} of Beamer

Beamer provides an easy way to change the color used by the environment `{alertenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `luatex` (that extension requires also the package `luacolor`).

```

\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
  {\renewenvironment{alertenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother

```

That code redefines locally the environment `{alertenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertenv}`).

6.6 Footnotes in the environments of piton

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark–\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferably. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

In this document, the package `piton` has been loaded with the option `footnotehyper`. For examples of notes, cf. 8.3, p. 22.

6.7 Tabulations

Even though it's recommended to indent the Python listings with spaces (see PEP 8), `piton` accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by n spaces. The initial value of n is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value n of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces).

7 API for the developpers

The L3 variable `\l_piton_language_str` contains the name of the current language of `piton` (in lower case).

New 2.6

The extension `piton` provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of `piton`.

- The carriage returns (which are present in the initial environment) appears as characters `\r` (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 4).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` (cf. part 6.4.3) and the elements inserted by the mechanism “`escape`” (cf. part 6.4.4).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 8.5, p. 24.

8 Examples

8.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the Python listings by using the key `line-numbers`.

By default, the numbers of the lines are composed by `piton` in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!10, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

8.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with `#>`) aligned on the right margin.

```
\PitonOptions{background-color=gray!10}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)   another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`. Several compilations are required.

```
\PitonOptions{background-color=gray!10, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)                                recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)                          another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

8.3 Notes in the listings

In order to be able to extract the notes (which are typeset with the command `\footnote`), the extension piton must be loaded with the key `footnote` or the key `footnotehyper` as explained in the section 6.6 p. 20. In this document, the extension piton has been loaded with the key `footnotehyper`. Of course, in an environment `{Piton}`, a command `\footnote` may appear only within a LaTeX comment (which begins with `#>`). It's possible to have comments which contain only that command `\footnote`. That's the case in the following example.

```
\PitonOptions{background-color=gray!10}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)28
    elif x > 1:
        return pi/2 - arctan(1/x)29
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

²⁸First recursive call.

²⁹Second recursive call.

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can't be broken by a page break.

```
\PitonOptions{background-color=gray!10}
\emphase\begin{minipage}{\linewidth}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}

adef arctan(x,n=10):
a    if x < 0:
a        return -arctan(-x)a
b    elif x > 1:
b        return pi/2 - arctan(1/x)b
c    else:
c        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

^aFirst recursive call.

^bSecond recursive call.

8.4 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 6.

We present now an example of tuning of these styles adapted to the documents in black and white. We use the font *DejaVu Sans Mono*³⁰ specified by the command `\setmonofont` of `fontspec`.

That tuning uses the command `\highLight` of `luatex` (that package requires itself the package `luacolor`).

```
\setmonofont[Scale=0.85]{DejaVu Sans Mono}

\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
    Comment.LaTeX = \normalfont \color{gray},
    Keyword = \bfseries ,
    Name.Namespace = ,
    Name.Class = ,
    Name.Type = ,
    InitialValues = \color{gray}
}
```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formating instruction (the element will be composed in the standard color, usually

³⁰See: <https://dejavu-fonts.github.io>

in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in `piton` is *not* empty.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) =  $\pi/2$  for  $x > 0$ )
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x***(2*k+1)
    return s
```

8.5 Use with pyluatex

The package `pylumatex` is an extension which allows the execution of some Python code from `lualatex` (provided that Python is installed on the machine and that the compilation is done with `lualatex` and `--shell-escape`).

Here is, for example, an environment `{PitonExecute}` which formats a Python listing (with `piton`) but also displays the output of the execution of the code with Python.

```
\NewPitonEnvironment{PitonExecute}{!0{}}
{\PitonOptions{#1}}
{\begin{center}
\directlua{pylumatex.execute(piton.get_last_code(), false, true, false, true)}%
\end{center}
\ignorespacesafterend}
```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 7, p. 20.

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

9 The styles for the different computer languages

9.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.³¹

Style	Use
<code>Number</code>	the numbers
<code>String.Short</code>	the short strings (entre ' ou ")
<code>String.Long</code>	the long strings (entre ''' ou """)) excepted the doc-strings (governed by <code>String.Doc</code>)
<code>String</code>	that key fixes both <code>String.Short</code> et <code>String.Long</code>
<code>String.Doc</code>	the doc-strings (only with """ following PEP 257)
<code>String.Interpol</code>	the syntactic elements of the fields of the f-strings (that is to say the characters { et }); that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
<code>Interpol.Inside</code>	the content of the interpolations in the f-strings (that is to say the elements between { and }); if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Operator</code>	the following operators: != == << >> - ~ + / * % = < > & . @
<code>Operator.Word</code>	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
<code>Name.Builtin</code>	almost all the functions predefined by Python
<code>Name.Decorator</code>	the decorators (instructions beginning by @)
<code>Name.Namespace</code>	the name of the modules
<code>Name.Class</code>	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code>)
<code>Name.Function</code>	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code>)
<code>UserFunction</code>	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and, hence, these elements are drawn, by default, in the current color, usually black)
<code>Exception</code>	les exceptions pré définies (ex.: <code>SyntaxError</code>)
<code>InitialValues</code>	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
<code>Comment</code>	the comments beginning with #
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
<code>Keyword.Constant</code>	<code>True</code> , <code>False</code> et <code>None</code>
<code>Keyword</code>	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .

³¹See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color #F0F3F3. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

9.2 The language OCaml

It's possible to switch to the language OCaml with \PitonOptions{language = OCaml}.

It's also possible to set the language OCaml for an individual environment {Piton}.

```
\begin{Piton}[language=OCaml]
...
\end{Piton}
```

The option exists also for \PitonInputFile : \PitonInputFile[language=OCaml]{...}

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both String.Short and String.Long
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : and, asr, land, lor, lsl, lxor, mod et or
Name.Builtin	les fonctions not, incr, decr, fst et snd
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the OCaml functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Exception	the predefined exceptions (eg : End_of_File)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	true et false
Keyword	the following keywords: assert, as, begin, class, constraint, done, downto, do, else, end, exception, external, for, function, functor, fun , if include, inherit, initializer, in , lazy, let, match, method, module, mutable, new, object, of, open, private, raise, rec, sig, struct, then, to, try, type, value, val, virtual, when, while and with

9.3 The language C (and C++)

It's possible to switch to the language C with `\PitonOptions{language = C}`.

It's also possible to set the language C for an individual environment `{Piton}`.

```
\begin{Piton}[language=C]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=C]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & . @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while

9.4 The language SQL

It's possible to switch to the language SQL with `\PitonOptions{language = SQL}`.

It's also possible to set the language SQL for an individual environment `{Piton}`.

```
\begin{Piton}[language=SQL]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=SQL]{...}`

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code>)
<code>Operator</code>	the following operators : = != <> >= > < <= * + /
<code>Name.Table</code>	the names of the tables
<code>Name.Field</code>	the names of the fields of the tables
<code>Name.Builtin</code>	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
<code>Comment</code>	the comments (beginning by -- or between /* and */)
<code>Comment.LaTeX</code>	the comments beginning by --> which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the following keywords (their names are <i>not</i> case-sensitive): add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when and with.

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

9.5 The language “minimal”

It's possible to switch to the language “minimal” with `\PitonOptions{language = minimal}`.

It's also possible to set the language “minimal” for an individual environment `{Piton}`.

```
\begin{Piton}[language=minimal]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=minimal]{...}`

Style	Usage
<code>Number</code>	the numbers
<code>String</code>	the strings (between ")
<code>Comment</code>	the comments (which begin with #)
<code>Comment.LaTeX</code>	the comments beginning with #>, which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 6.3, p. 13) in order to create, for example, a language for pseudo-code.

9.6 The languages defined by \NewPitonLanguage

The command `\NewPitonLanguage`, which defines new informatic languages with the syntax of the extension `listings`, has been described p. 9.

All the languages defined by the command `\NewPitonLanguage` use the same styles.

Style	Use
<code>Number</code>	the numbers
<code>String.Long</code>	the strings defined in <code>\NewPitonLanguage</code> by the key <code>morestring</code>
<code>Comment</code>	the comments defined in <code>\NewPitonLanguage</code> by the key <code>morecomment</code>
<code>Comment.LaTeX</code>	the comments which are composed by piton as LaTeX code (merely named “LaTeX comments” in this document)
<code>Keyword</code>	the keywords defined in <code>\NewPitonLanguage</code> by the keys <code>morekeywords</code> and <code>moretexcs</code> (and also the key <code>sensitive</code> which specifies whether the keywords are case-sensitive or not)
<code>Directive</code>	the directives defined in <code>\NewPitonLanguage</code> by the key <code>moredirectives</code>
<code>Tag</code>	the “tags” defined by the key <code>tag</code> (the lexical units detected within the tag will also be formatted with their own style)

10 Implementation

The development of the extension `piton` is done on the following GitHub depot:
<https://github.com/fpantigny/piton>

10.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code with *interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.³²

Consider, for example, the following Python code:

```
def parity(x):
    return x%2
```

The capture returned by the `lpeg python` against that code is the Lua table containing the following elements :

```
{ "\\\_piton_begin_line:" }a
{ "{\PitonStyle{Keyword}{}}"b
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Name.Function}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, "(" }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ luatexbase.catcodetables.CatcodeTableOther, ")" }
{ luatexbase.catcodetables.CatcodeTableOther, ":" }
{ "\\\_piton_end_line: \\\_piton_newline: \\\_piton_begin_line:" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ "{\PitonStyle{Keyword}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "return" }
{ "}" }
{ luatexbase.catcodetables.CatcodeTableOther, " " }
{ luatexbase.catcodetables.CatcodeTableOther, "x" }
{ "{\PitonStyle{Operator}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "&" }
{ "}" }
{ "{\PitonStyle{Number}{}}"
{ luatexbase.catcodetables.CatcodeTableOther, "2" }
{ "}" }
{ "\\\_piton_end_line:" }
```

^aEach line of the Python listings will be encapsulated in a pair: `_@@_begin_line: - \@@_end_line:`. The token `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`. Both tokens `_@@_begin_line:` and `\@@_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

^bThe lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

^c`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

³²Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character \r will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by \ExplSyntaxOn)

```
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{def}}
\_\_piton\_end\_line:{\PitonStyle{Name.Function}{parity}}(x):\_\_piton\_newline:
\_\_piton\_begin\_line:{\PitonStyle{Keyword}{return}}
\_\_piton\_end\_line:{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}\_\_piton\_newline:
```

10.2 The L3 part of the implementation

10.2.1 Declaration of the package

```
1  {*STY}
2  \NeedsTeXFormat{LaTeX2e}
3  \RequirePackage{13keys2e}
4  \ProvidesExplPackage
5    {piton}
6    {\PitonFileVersion}
7    {\PitonFileDate}
8    {Highlight informatic listings with LPEG on LuaLaTeX}

9  \cs_new_protected:Npn \@@_error:n { \msg_error:nn { piton } }
10 \cs_new_protected:Npn \@@_warning:n { \msg_warning:nn { piton } }
11 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { piton } }

19    \globaldefs = 1
20    \msg_redirect_name:nnn { piton } { #1 } { none }
21    \group_end:
22 }
```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That's why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
23 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
24  {
25    \bool_if:NTF \g_@@_messages_for_Overleaf_bool
26      { \msg_new:nnn { piton } { #1 } { #2 \\ #3 } }
27      { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
28 }
```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by curryfication.

```
29 \cs_new_protected:Npn \@@_error_or_warning:n
30  { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always “output”.

```
31 \bool_new:N \g_@@_messages_for_Overleaf_bool
32 \bool_gset:Nn \g_@@_messages_for_Overleaf_bool
33  {
34    \str_if_eq_p:on \c_sys_jobname_str { _region_ } % for Emacs
35    || \str_if_eq_p:on \c_sys_jobname_str { output } % for Overleaf
36 }
```

139     }
140 }

```

The flag `\g_@@_footnote_bool` is raised and so, we will only have to test `\g_@@_footnote_bool` in order to know if we have to insert an environment `{savenotes}`.

```

141 \lua_now:n
142 {
143     piton.ListCommands = lpeg.P ( false )
144     piton.last_code = ''
145     piton.last_language = ''
146 }

```

10.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

147 \str_new:N \l_piton_language_str
148 \str_set:Nn \l_piton_language_str { python }

```

Each time the command `\PitonInputFile` of `piton` is used, the code of that environment will be stored in the following global string.

```
149 \tl_new:N \g_piton_last_code_tl
```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```
150 \seq_new:N \l_@@_path_seq
```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```
151 \str_new:N \l_@@_path_write_str
```

In order to have a better control over the keys.

```

152 \bool_new:N \l_@@_in_PitonOptions_bool
153 \bool_new:N \l_@@_in_PitonInputFile_bool

```

We will compute (with Lua) the numbers of lines of the Python code and store it in the following counter.

```
154 \int_new:N \l_@@_nb_lines_int
```

The same for the number of non-empty lines of the Python codes.

```
155 \int_new:N \l_@@_nb_non_empty_lines_int
```

The following counter will be used to count the lines during the composition. It will count all the lines, empty or not empty. It won't be used to print the numbers of the lines.

```
156 \int_new:N \g_@@_line_int
```

The following token list will contain the (potential) informations to write on the `aux` (to be used in the next compilation).

```
157 \tl_new:N \g_@@_aux_tl
```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to `n`, then no line break can occur within the first `n` lines or the last `n` lines of the listings.

```
158 \int_new:N \l_@@_splittable_int
```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the informatic code provided by the final user is split in chunks on the empty lines in the code).

```
159 \tl_new:N \l_@@_split_separation_tl
160 \tl_set:Nn \l_@@_split_separation_tl { \vspace{\baselineskip} \vspace{-1.25pt} }
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
161 \int_set:Nn \l_@@_splittable_int { 100 }
```

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
162 \clist_new:N \l_@@_bg_color_clist
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
163 \tl_new:N \l_@@_prompt_bg_color_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
164 \str_new:N \l_@@_begin_range_str
165 \str_new:N \l_@@_end_range_str
```

The argument of `\PitonInputFile`.

```
166 \str_new:N \l_@@_file_name_str
```

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@_env_int`).

```
167 \int_new:N \g_@@_env_int
```

The parameter `\l_@@_writer_str` corresponds to the key `write`. We will store the list of the files already used in `\g_@@_write_seq` (we must not erase a file which has been still been used).

```
168 \str_new:N \l_@@_write_str
169 \seq_new:N \g_@@_write_seq
```

The following boolean corresponds to the key `show-spaces`.

```
170 \bool_new:N \l_@@_show_spaces_bool
```

```
171 \bool_new:N \l_@@_break_lines_in_Piton_bool
172 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
173 \tl_new:N \l_@@_continuation_symbol_tl
174 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
175 \tl_new:N \l_@@_csoi_tl
176 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \$ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
177 \tl_new:N \l_@@_end_of_broken_line_tl
178 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
179 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the aux file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_line_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

```
180 \dim_new:N \l_@@_width_dim
```

We will also use another dimension called `\l_@@_line_width_dim`. That will the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

```
181 \dim_new:N \l_@@_line_width_dim
```

The following flag will be raised with the key `width` is used with the special value `min`.

```
182 \bool_new:N \l_@@_width_min_bool
```

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `{Piton}` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the spacial value `min`. We need a global variable because, when the key `footnote` is in force, each line when be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

```
183 \dim_new:N \g_@@_tmp_width_dim
```

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

```
184 \dim_new:N \l_@@_left_margin_dim
```

The following boolean will be set when the key `left-margin=auto` is used.

```
185 \bool_new:N \l_@@_left_margin_auto_bool
```

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

```
186 \dim_new:N \l_@@_numbers_sep_dim
187 \dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }
```

The tabulators will be replaced by the content of the following token list.

```
188 \tl_new:N \l_@@_tab_tl
```

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by piton. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

```
189 \seq_new:N \g_@@_languages_seq
```

```
190 \cs_new_protected:Npn \@@_set_tab_tl:n #1
191 {
192     \tl_clear:N \l_@@_tab_tl
193     \prg_replicate:nn { #1 }
194         { \tl_put_right:Nn \l_@@_tab_tl { ~ } }
195 }
196 \@@_set_tab_tl:n { 4 }
```

When the key `show-spaces` is in force, `\l_@@_tab_tl` will be replaced by an arrow by using the following command.

```

197 \cs_new_protected:Npn \@@_convert_tab_tl:
198 {
199   \hbox_set:Nn \l_tmpa_box { \l_@@_tab_tl }
200   \dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }
201   \tl_set:Nn \l_@@_tab_tl
202   {
203     \c{\mathcolor{gray}}
204     { \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } \c{} }
205   }
206 }
```

The following integer corresponds to the key `gobble`.

```
207 \int_new:N \l_@@_gobble_int
```

The following token list will be used only for the spaces in the strings.

```

208 \tl_new:N \l_@@_space_tl
209 \tl_set_eq:NN \l_@@_space_tl \nobreakspace
```

At each line, the following counter will count the spaces at the beginning.

```
210 \int_new:N \g_@@_indentation_int
```

```

211 \cs_new_protected:Npn \@@_an_indentation_space:
212   { \int_gincr:N \g_@@_indentation_int }
```

The following command `\@@_beamer_command:n` executes the argument corresponding to its argument but also stores it in `\l_@@_beamer_command_str`. That string is used only in the error message “`cr~not~allowed`” raised when there is a carriage return in the mandatory argument of that command.

```

213 \cs_new_protected:Npn \@@_beamer_command:n #1
214 {
215   \str_set:Nn \l_@@_beamer_command_str { #1 }
216   \use:c { #1 }
217 }
```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```

218 \cs_new_protected:Npn \@@_label:n #1
219 {
220   \bool_if:NTF \l_@@_line_numbers_bool
221   {
222     \@bsphack
223     \protected@write \auxout { }
224     {
225       \string \newlabel { #1 }
226     }
227   }
```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```

228   { \int_eval:n { \g_@@_visual_line_int + 1 } }
229   { \thepage }
230 }
231 \@esphack
232 }
233 { \@@_error:n { label-with-lines-numbers } }
234 }
```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by piton the part which must be included (and formatted).

```
235 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
236 \cs_new_protected:Npn \@@_marker_end:n #1 { }
```

The following commands are a easy way to insert safely braces (`{` and `}`) in the TeX flow.

```
237 \cs_new_protected:Npn \@@_open_brace: { \lua_now:n { piton.open_brace() } }
238 \cs_new_protected:Npn \@@_close_brace: { \lua_now:n { piton.close_brace() } }
```

The following token list will be evaluated at the beginning of `\@@_begin_line:...` `\@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
239 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```
240 \cs_new_protected:Npn \@@_prompt:
241 {
242     \tl_gset:Nn \g_@@_begin_line_hook_tl
243     {
244         \tl_if_empty:NF \l_@@_prompt_bg_color_tl
245             { \clist_set:NV \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
246     }
247 }
```

10.2.3 Treatment of a line of code

The following command is only used once.

```
248 \cs_new_protected:Npn \@@_replace_spaces:n #1
249 {
250     \tl_set:Nn \l_tmpa_tl { #1 }
251     \bool_if:NTF \l_@@_show_spaces_bool
252     {
253         \tl_set:Nn \l_@@_space_tl { \u{20} }
254         \regex_replace_all:nnN { \x20 } { \u{20} } \l_tmpa_tl % U+2423
255     }
256 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:`. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```
257     \bool_if:NT \l_@@_break_lines_in_Piton_bool
258     {
259         \regex_replace_all:nnN
260             { \x20 }
261             { \c{@@_breakable_space}: }
262         \l_tmpa_tl
263     }
264     \l_tmpa_tl
265 }
```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`. `\@@_begin_line:` is a LaTeX command that we will define now but `\@@_end_line:` is only a syntactic marker that has no definition.

```

267 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
268 {
269     \group_begin:
270     \g_@@_begin_line_hook_tl
271     \int_gzero:N \g_@@_indentation_int

```

First, we will put in the coffin \l_tmpa_coffin the actual content of a line of the code (without the potential number of line).

Be careful: There is curryfication in the following code.

```

272 \bool_if:NTF \l_@@_width_min_bool
273     \@@_put_in_coffin_i:n
274     \@@_put_in_coffin_i:n
275 {
276     \language = -1
277     \raggedright
278     \strut
279     \@@_replace_spaces:n { #1 }

322       }
323   \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
324   \box_use_drop:N \l_tmpa_box
325 }
326 }
327 \vspace { - 2.5 pt }
328 \group_end:
329 \tl_gclear:N \g_@@_begin_line_hook_tl
330 }
```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contains several lines when the key `broken-lines-in-Piton` (or `broken-lines`) is used.

That commands takes in its argument by curryfication.

```

331 \cs_set_protected:Npn \@@_put_in_coffin_i:n
332   { \vcoffin_set:Nnn \l_tmpa_coffin \l_@@_line_width_dim }
```

The second case is the case when the key `width` is used with the special value `min`.

```

333 \cs_set_protected:Npn \@@_put_in_coffin_ii:n #1
334 {
```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the `aux` file in the variable `\l_@@_width_dim`).

```
335   \hbox_set:Nn \l_tmpa_box { #1 }
```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the `aux` file the natural width of the environment).

```

336   \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
337   { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
338   \hcoffin_set:Nn \l_tmpa_coffin
339   {
340     \hbox_to_wd:nn \l_@@_line_width_dim
```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 8.2, p. 21).

```

341   { \hbox_unpack:N \l_tmpa_box \hfil }
342 }
343 }
```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```

344 \cs_set_protected:Npn \@@_color:N #1
345 {
346   \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
347   \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
348   \tl_set:Nx \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
349   \tl_if_eq:NnTF \l_tmpa_tl { none }
```

By setting `\l_@@_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```

350   { \dim_zero:N \l_@@_width_dim }
351   { \exp_args:NV \@@_color_i:n \l_tmpa_tl }
352 }
```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```

659 }

```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different than in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

660 \NewDocumentCommand \@@_fake_PitonOptions { }
661 { \keys_set:nn { PitonOptions } }

```

10.2.5 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`).

```

662 \int_new:N \g_@@_visual_line_int
663 \cs_new_protected:Npn \@@_incr_visual_line:
664 {
665     \bool_if:NF \l_@@_skip_empty_lines_bool
666     { \int_gincr:N \g_@@_visual_line_int }
667 }

668 \cs_new_protected:Npn \@@_print_number:
669 {
670     \hbox_overlap_left:n
671     {
672         {
673             \color { gray }
674             \footnotesize
675             \int_to_arabic:n \g_@@_visual_line_int
676         }
677         \skip_horizontal:N \l_@@_numbers_sep_dim
678     }
679 }

```

10.2.6 The command to write on the aux file

```

680 \cs_new_protected:Npn \@@_write_aux:
681 {
682     \tl_if_empty:NF \g_@@_aux_tl
683     {
684         \iow_now:Nn \mainaux { \ExplSyntaxOn }
685         \iow_now:Nx \mainaux
686         {

```

```

687         \tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ tl }
688             { \exp_not:o \g_@@_aux_tl }
689     }
690     \iow_now:Nn \mainaux { \ExplSyntaxOff }
691 }
692 \tl_gclear:N \g_@@_aux_tl
693 }
```

The following macro will be used only when the key `width` is used with the special value `min`.

```

694 \cs_new_protected:Npn \@@_width_to_aux:
695 {
696     \tl_gput_right:Nx \g_@@_aux_tl
697     {
698         \dim_set:Nn \l_@@_line_width_dim
699             { \dim_eval:n { \g_@@_tmp_width_dim } }
700     }
701 }
```

10.2.7 The main commands and environments for the final user

```

702 \NewDocumentCommand { \NewPitonLanguage } { O { } m ! o }
703 {
704     \tl_if_novalue:nTF { #3 }
```

The last argument is provided by currying.

```
705     { \@@_NewPitonLanguage:nn { #1 } { #2 } }
```

The two last arguments are provided by currying.

```
706     { \@@_NewPitonLanguage:nnnn { #1 } { #2 } { #3 } }
707 }
```

The following property list will contain the definitions of the informatic languages as provided by the final user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```
708 \prop_new:N \g_@@_languages_prop
```

The function `\@@_NewPitonLanguage:nn` will be used when the language is *not* defined above a base language (and a base dialect).

```
709 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2 #3
710 {
```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : [AspectJ]{Java}. We use `\tl_if_blank:nF` because the final user may have written `\NewPitonLanguage[]{Java}{...}`.

```
711     \tl_set:Nx \l_tmpa_tl
712     {
713         \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
714         \str_lowercase:n { #2 }
715     }
```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```
716     \prop_gput:Non \g_@@_languages_prop \l_tmpa_tl { #3 }
```

The Lua part of the package piton will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the utilisation of the Lua function `piton.new_language` (which does the main job).

```
717     \exp_args:NV \@@_NewPitonLanguage:nn \l_tmpa_tl { #3 }
718 }
719 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
720 {
721     \hook_gput_code:nnn { begindocument } { . }
722     { \lua_now:e { piton.new_language("#1", "\lua_escape:n{#2}") } }
```

```
723     }
```

Now the case when the language is defined upon a base language.

```
724 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4 #5
725 {
```

We store in `\l_tmpa_tl` the name of the base language with the dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have used `\NewPitonLanguage[Handel]{C}[]{C}{...}`

```
726     \tl_set:Nx \l_tmpa_tl
727     {
728         \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
729         \str_lowercase:n { #4 }
730     }
```

We retrieve in `\l_tmpb_tl` the definition (as provided by the final user) of that base language. Caution: `\g_@@_languages_prop` does not contain all the languages provided by piton but only those defined by using `\NewPitonLanguage`.

```
731     \prop_get:NoNTF \g_@@_languages_prop \l_tmpa_tl \l_tmpb_tl
```

We can now define the new language by using the previous function.

```
732     { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_tl }
733     { \@@_error:n { Language-not-defined } }
734 }
```

```
735 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4
```

In the following line, we write `#4, #3` and not `#3, #4` because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```
736     { \@@_NewPitonLanguage:nnn { #1 } { #2 } { #4 , #3 } }
737 \cs_generate_variant:Nn \@@_NewPitonLanguage:nnnn { n n n o }
```

```
738 \NewDocumentCommand { \piton } { }
739     { \peek_meaning:NTF \bgroup \@@_piton_standard \@@_piton_verbatim }
740 \NewDocumentCommand { \@@_piton_standard } { m }
741 {
742     \group_begin:
743     \ttfamily
```

The following tuning of LuaTeX in order to avoid all break of lines on the hyphens.

```
744 \automatichyphenmode = 1
745 \cs_set_eq:NN \\ \c_backslash_str

864 }
```

If the final user has used both `left-margin=auto` and `line-numbers`, we have to compute the width of the maximal number of lines at the end of the environment to fix the correct value to `left-margin`. The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

865 \cs_new_protected:Npn \@@_compute_left_margin:nn #1 #2
866 {
867   \bool_lazy_and:nnT \l_@@_left_margin_auto_bool \l_@@_line_numbers_bool
868   {
869     \hbox_set:Nn \l_tmpa_box
```

```

870     {
871         \footnotesize
872         \bool_if:NTF \l_@@_skip_empty_lines_bool
873         {
874             \lua_now:n
875             { \piton.#1(token.scan_argument()) }
876             { #2 }
877             \int_to_arabic:n
878             { \g_@@_visual_line_int + \l_@@_nb_non_empty_lines_int }
879         }
880         {
881             \int_to_arabic:n
882             { \g_@@_visual_line_int + \l_@@_nb_lines_int }
883         }
884     }
885     \dim_set:Nn \l_@@_left_margin_dim
886     { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
887 }
888 }
889 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }

```

Whereas $\l_@@_width_dim$ is the width of the environment, $\l_@@_line_width_dim$ is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute $\l_@@_line_width_dim$ from $\l_@@_width_dim$ or we have to do the opposite.

```

890 \cs_new_protected:Npn \@@_compute_width:
891 {
892     \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
893     {
894         \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
895         \clist_if_empty:NTF \l_@@_bg_color_clist

```

If there is no background, we only subtract the left margin.

```
896         { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
```

If there is a background, we subtract 0.5 em for the margin on the right.

```
897         {
898             \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }
```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), $\l_@@_left_margin_dim$ has a non-zero value³³ and we use that value. Elsewhere, we use a value of 0.5 em.

```

899         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
900         { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
901         { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
902     }
903 }
```

If $\l_@@_line_width_dim$ has yet a non-zero value, that means that it has been read in the `aux` file: it has been written by a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```

904     {
905         \dim_set_eq:NN \l_@@_width_dim \l_@@_line_width_dim
906         \clist_if_empty:NTF \l_@@_bg_color_clist
907         { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
908         {
909             \dim_add:Nn \l_@@_width_dim { 0.5 em }
910             \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
911             { \dim_add:Nn \l_@@_width_dim { 0.5 em } }
912             { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
913         }

```

³³If the key `left-margin` has been used with the special value `min`, the actual value of $\l_@@_left_margin_dim$ has yet been computed when we use the current command.

```

914     }
915 }

916 \NewDocumentCommand { \NewPitonEnvironment } { m m m m }
917 {

```

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 (“other”). The latter explains why the definition of that function is a bit complicated.

```

918   \use:x
919   {
920     \cs_set_protected:Npn
921       \use:c { _@@_collect_ #1 :w }
922       #####1
923       \c_backslash_str end \c_left_brace_str #1 \c_right_brace_str
924   }
925   {
926     \group_end:
927     \mode_if_vertical:TF \mode_leave_vertical: \newline

```

We count with Lua the number of lines of the argument. The result will be stored by Lua in `\l_@@_nb_lines_int`. That information will be used to allow or disallow page breaks. The use of `token.scan_argument` avoids problems with the delimiters of the Lua string.

```
928   \lua_now:n { piton.CountLines(token.scan_argument()) } { ##1 }
```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

929   \@@_compute_left_margin:nn { CountNonEmptyLines } { ##1 }
930   \@@_compute_width:
931   \ttfamily
932   \dim_zero:N \parskip

```

Now, the key `write`.

```

933   \str_if_empty:NTF \l_@@_path_write_str
934     { \lua_now:e { piton.write = "\l_@@_write_str" } }
935     {
936       \lua_now:e
937         { piton.write = "\l_@@_path_write_str / \l_@@_write_str" }
938     }
939   \str_if_empty:NTF \l_@@_write_str
940     { \lua_now:n { piton.write = '' } }
941     {
942       \seq_if_in:NNTF \g_@@_write_seq \l_@@_write_str
943         { \lua_now:n { piton.write_mode = "a" } }
944         {
945           \lua_now:n { piton.write_mode = "w" }
946           \seq_gput_left:NV \g_@@_write_seq \l_@@_write_str
947         }
948     }

```

Now, the main job.

```

949   \bool_if:NTF \l_@@_split_on_empty_lines_bool
950     \@@_gobble_split_parse:n
951     \@@_gobble_parse:n
952     { ##1 }

```

If the user has used the key `width` with the special value `min`, we write on the `aux` file the value of `\l_@@_line_width_dim` (largest width of the lines of code of the environment).

```
953   \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:
```

The following `\end{#1}` is only for the stack of environments of LaTeX.

```

954   \end { #1 }
955   \@@_write_aux:
956 }
```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment`...

```

957 \NewDocumentEnvironment { #1 } { #2 }
958 {
959     \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
960     #3
961     \@@_pre_env:
962     \int_compare:nNnT \l_@@_number_lines_start_int > \c_zero_int
963         { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
964     \group_begin:
965     \tl_map_function:nN
966         { \ \\ \{ \} \$ \& \# \^ \_ \% \~ \^{\!} }
967         \char_set_catcode_other:N
968         \use:c { _@@_collect_ #1 :w }
969     }
970 { #4 }
```

The following code is for technical reasons. We want to change the catcode of `\^M` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the `\^M` is converted to space).

```

971     \AddToHook { env / #1 / begin } { \char_set_catcode_other:N \^{\!} }
972 }
```

This is the end of the definition of the command `\NewPitonEnvironment`.

The following function will be used when the key `split-on-empty-lines` is not in force. It will gobble the spaces at the beginning of the lines and parse the code. The argument is provided by curryfication.

```

973 \cs_new_protected:Npn \@@_gobble_parse:n
974 {
975     \lua_now:e
976     {
977         piton.GobbleParse
978         (
979             '\l_piton_language_str' ,
980             \int_use:N \l_@@_gobble_int ,
981             token.scan_argument ( )
982         )
983     }
984 }
```

The following function will be used when the key `split-on-empty-lines` is in force. It will gobble the spaces at the beginning of the lines (if the key `gobble` is in force), then split the code at the empty lines and, eventually, parse the code. The argument is provided by curryfication.

```

985 \cs_new_protected:Npn \@@_gobble_split_parse:n
986 {
987     \lua_now:e
988     {
989         piton.GobbleSplitParse
990         (
991             '\l_piton_language_str' ,
992             \int_use:N \l_@@_gobble_int ,
993             token.scan_argument ( )
994         )
995     }
996 }
```

Now, we define the environment `{Piton}`, which is the main environment provided by the package `piton`. Of course, you use `\NewPitonEnvironment`.

```

997 \bool_if:NTF \g_@@_beamer_bool
998 {
999     \NewPitonEnvironment { Piton } { d < > 0 { } }
```

```

1000    {
1001        \keys_set:nn { PitonOptions } { #2 }
1002        \tl_if_novalue:nTF { #1 }
1003            { \begin { uncoverenv } }
1004            { \begin { uncoverenv } < #1 > }
1005        }
1006    { \end { uncoverenv } }
1007 }
1008 {
1009     \NewPitonEnvironment { Piton } { 0 { } }
1010     { \keys_set:nn { PitonOptions } { #1 } }
1011     { }
1012 }

```

The code of the command `\PitonInputFile` is somewhat similar to the code of the environment `{Piton}`. In fact, it's simpler because there isn't the problem of catching the content of the environment in a verbatim mode.

```

1013 \NewDocumentCommand { \PitonInputFileTF } { d < > 0 { } m m m }
1014 {
1015     \group_begin:

```

The boolean `\l_tmap_bool` will be raised if the file is found somewhere in the path (specified by the key `path`).

1254 }
```

The last styles `ParseAgain.noCR` and `ParseAgain` should be considered as “internal style” (not available for the final user). However, maybe we will change that and document these styles for the final user (why not?).

If the key `math-comments` has been used at load-time, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document].

```
1255 \AtBeginDocument
1256 {
```

```

1257     \bool_if:NT \g_@@_math_comments_bool
1258         { \SetPitonStyle { Comment.Math = \@@_math_scantokens:n } }
1259     }

```

10.2.10 Highlighting some identifiers

```

1260 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1261 {
1262     \clist_set:Nn \l_tmpa_clist { #2 }
1263     \tl_if_no_value:nTF { #1 }
1264     {
1265         \clist_map_inline:Nn \l_tmpa_clist
1266             { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1267     }
1268     {
1269         \str_set:Nx \l_tmpa_str { \str_lowercase:n { #1 } }
1270         \str_if_eq:onT \l_tmpa_str { current-language }
1271             { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1272         \clist_map_inline:Nn \l_tmpa_clist
1273             { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1274     }
1275 }
1276 \cs_new_protected:Npn \@@_identifier:n #1
1277 {
1278     \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1279         { \cs_if_exist_use:c { PitonIdentifier _ #1 } }
1280     { #1 }
1281 }

```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```

1282 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1283 {

```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```

1284     { \PitonStyle { Name.Function } { #1 } }

```

Now, we specify that the name of the new Python function is a known identifier that will be formated with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```

1285     \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1286     { \PitonStyle { UserFunction } }

```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```

1287     \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1288         { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1289     \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }

```

We update `\g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```

1290     \seq_if_in:NVF \g_@@_languages_seq \l_piton_language_str
1291         { \seq_gput_left:NV \g_@@_languages_seq \l_piton_language_str }
1292     }

```

```

1293 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1294 {
1295     \tl_if_no_value:nTF { #1 }

```

If the command is used without its optional argument, we will deleted the user language for all the informatic languages.

```

1296     { \@@_clear_all_functions: }
1297     { \@@_clear_list_functions:n { #1 } }
1298 }

10.2.14 Detected commands

```

1492 \ExplSyntaxOff
1493 \begin{luacode*}
1494     lpeg.locale(lpeg)
1495     local P , alpha , C , space , S , V
1496     = lpeg.P , lpeg.alpha , lpeg.C , lpeg.space , lpeg.S , lpeg.V
1497     local function add(...)
1498         local s = P ( false )
1499         for _ , x in ipairs({...}) do s = s + x end
1500         return s
1501     end
1502     local my_lpeg =
1503     P { "E" ,
1504         E = ( V "F" * ( "," * V "F" ) ^ 0 ) / add ,

```

Be careful: in Lua, / has no priority over *. Of course, we want a behaviour for this comma-separated list equal to the behaviour of a *clist* of L3.

```

1505         F = space ^ 0 * ( ( alpha ^ 1 ) / "\\\%0" ) * space ^ 0
1506     }
1507     function piton.addListCommands( key_value )
1508         piton.ListCommands = piton.ListCommands + my_lpeg : match ( key_value )
1509     end
1510 \end{luacode*}
1511 </STY>

```

10.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```
1512  {*LUA}
1513  if piton.comment_latex == nil then piton.comment_latex = ">" end
1514  piton.comment_latex = "#" .. piton.comment_latex
```

The following functions are an easy way to safely insert braces (`{` and `}`) in the TeX flow.

```
1515  function piton.open_brace ()
1516      tex.print("{")
1517  end
1518  function piton.close_brace ()
1519      tex.print("}")
1520  end
1521  local function sprintL3 ( s )
1522      tex.print ( luatexbase.catcodetables.expl , s )
1523  end
1524  %     \end{uncoverenv}
1525  %
1526  % \bigskip
1527  % \subsubsection{Special functions dealing with LPEG}
1528  %
1529  % \medskip
1530  % We will use the Lua library \pkg{lpeg} which is built in LuaTeX. That's why we
1531  % define first aliases for several functions of that library.
1532  %     \begin{macrocode}
1533  local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1534  local Cs, Cg, Cmt, Cb = lpeg.Cs, lpeg.Cg, lpeg.Cmt, lpeg.Cb
1535  local R = lpeg.R
```

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it’s suitable for elements of the Python listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```
1536  local function Q ( pattern )
1537      return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1538  end
```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It’s suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won’t be much used.

```
1539  local function L ( pattern )
1540      return Ct ( C ( pattern ) )
1541  end
```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that’s the main job of `piton`). That function, unlike the previous one, will be widely used.

```
1542  local function Lc ( string )
1543      return Cc ( { luatexbase.catcodetables.expl , string } )
1544  end
```

The function K creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a piton style and the second element is a pattern (that is to say a LPEG without capture)

```

1545 e
1546 local function K ( style , pattern )
1547     return
1548     Lc ( "{\\PitonStyle{" .. style .. "}" )
1549     * Q ( pattern )
1550     * Lc "}}"
1551 end

```

The formatting commands in a given piton style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\\PitonStyle{Keyword}{text to format}}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```

1552 local function WithStyle ( style , pattern )
1553     return
1554     Ct ( Cc "Open" * Cc ( "{\\PitonStyle{" .. style .. "}" ) * Cc "}}" )
1555     * pattern
1556     * Ct ( Cc "Close" )
1557 end

```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```

1558 Escape = P ( false )
1559 EscapeClean = P ( false )
1560 if piton.begin_escape ~= nil
1561 then
1562     Escape =
1563     P ( piton.begin_escape )
1564     * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
1565     * P ( piton.end_escape )

```

The LPEG `EscapeClean` will be used in the LPEG Clean (and that LPEG is used to “clean” the code by removing the formatting elements).

```

1566 EscapeClean =
1567     P ( piton.begin_escape )
1568     * ( 1 - P ( piton.end_escape ) ) ^ 1
1569     * P ( piton.end_escape )
1570 end

1571 EscapeMath = P ( false )
1572 if piton.begin_escape_math ~= nil
1573 then
1574     EscapeMath =
1575     P ( piton.begin_escape_math )
1576     * Lc "\\ensuremath{"
1577     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1578     * Lc ( "}" )
1579     * P ( piton.end_escape_math )
1580 end

```

The following line is mandatory.

```
1581 lpeg.locale(lpeg)
```

The basic syntactic LPEG

```
1582 local alpha , digit = lpeg.alpha , lpeg.digit
1583 local space = P " "
```

Remember that, for LPEG, the Unicode characters such as à, á, ç, etc. are in fact strings of length 2 (2 bytes) because lpeg is not Unicode-aware.

```
1584 local letter = alpha + "_" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "ï" + "í"
1585           + "ô" + "û" + "ü" + "â" + "â" + "ç" + "é" + "è" + "ê" + "ë" +
1586           + "ï" + "î" + "ô" + "û" + "ü"
1587
1588 local alphanum = letter + digit
```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
1589 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
1590 local Identifier = K ( 'Identifier' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function `K`. By convention, we use single quotes for delimiting the Lua strings which are names of `piton` styles (but this is only a convention).

```
1591 local Number =
1592   K ( 'Number' ,
1593     ( digit ^ 1 * P "." * # ( 1 - P "." ) * digit ^ 0
1594       + digit ^ 0 * P "." * digit ^ 1
1595       + digit ^ 1 )
1596     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
1597     + digit ^ 1
1598   )
```

We recall that `piton.begin_espce` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```
1599 local Word
1600 if piton.begin_escape then
1601   Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1602               - S "'\"\\r[({})]" - digit ) ^ 1 )
1603 else
1604   Word = Q ( ( 1 - space - S "'\"\\r[({})]" - digit ) ^ 1 )
1605 end

1606 local Space = Q " " ^ 1
1607
1608 local SkipSpace = Q " " ^ 0
1609
1610 local Punct = Q ( S ".,:;!" )
1611
1612 local Tab = "\t" * Lc "\\\l_@@_tab_tl"

1613 local SpaceIndentation = Lc "\\\l_@@_an_indentation_space:" * Q " "
1614 local Delim = Q ( S "[({})]" )
```

The following LPEG catches a space (U+0020) and replace it by \l_@@_space_t1. It will be used in the strings. Usually, \l_@@_space_t1 will contain a space and therefore there won't be difference. However, when the key show-spaces-in-strings is in force, \\l_@@_space_t1 will contain □ (U+2423) in order to visualize the spaces.

```
1615 local VisualSpace = space * Lc "\\\l_@@_space_t1"
```

Several tools for the construction of the main LPEG

```
1616 local LPEG0 = { }
1617 local LPEG1 = { }
1618 local LPEG2 = { }
1619 local LPEG_cleaner = { }
```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings).

```
1620 local function Compute_braces ( lpeg_string ) return
1621     P { "E" ,
1622         E =
1623         (
1624             "{" * V "E" * "}"
1625             +
1626             lpeg_string
1627             +
1628             ( 1 - S "{}" )
1629         ) ^ 0
1630     }
1631 end
```

The following Lua function will compute the lpeg `DetectedCommands` which is a LPEG with captures).

```
1632 local function Compute_DetectedCommands ( lang , braces ) return
1633     Ct ( Cc "Open"
1634         * C ( piton.ListCommands * P "{" )
1635         * Cc "}"
1636     )
1637     * ( braces / (function ( s ) return LPEG1[lang] : match ( s ) end ) )
1638     * P "}"
1639     * Ct ( Cc "Close" )
1640 end

1641 local function Compute_LPEG_cleaner ( lang , braces ) return
1642     Ct ( ( piton.ListCommands * "{"
1643         * ( braces
1644             / ( function ( s ) return LPEG_cleaner[lang] : match ( s ) end ) )
1645         * "}"
1646         + EscapeClean
1647         + C ( P ( 1 ) )
1648     ) ^ 0 ) / table.concat
1649 end
```

Constructions for Beamer If the classe Beamer is used, some environments and commands of Beamer are automatically detected in the listings of piton.

```

1650 local Beamer = P ( false )
1651 local BeamerBeginEnvironments = P ( true )
1652 local BeamerEndEnvironments = P ( true )

1653 local list_beamer_env =
1654   { "uncoverenv" , "onlyenv" , "visibleenv" ,
1655     "invisibleenv" , "alertenv" , "actionenv" }

1656 local BeamerNamesEnvironments = P ( false )
1657 for _ , x in ipairs ( list_beamer_env ) do
1658   BeamerNamesEnvironments = BeamerNamesEnvironments + x
1659 end

1660 BeamerBeginEnvironments =
1661   ( space ^ 0 *
1662     L
1663     (
1664       P "\begin{" * BeamerNamesEnvironments * "}"
1665       * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1666     )
1667     * "\r"
1668   ) ^ 0

1669 BeamerEndEnvironments =
1670   ( space ^ 0 *
1671     L ( P "\end{" * BeamerNamesEnvironments * "}" )
1672     * "\r"
1673   ) ^ 0

```

The following Lua function will be used to compute the LPEG Beamer for each informatic language.

```
1674 local function Compute_Beamer ( lang , braces )
```

We will compute in lpeg the LPEG that we will return.

```

1675 local lpeg = L ( P "\pause" * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
1676 lpeg = lpeg +
1677   Ct ( Cc "Open"
1678     * C ( ( P "\uncover" + "\only" + "\alert" + "\visible"
1679       + "\invisible" + "\action" )
1680     * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1681     * P "{"
1682     )
1683     * Cc "}"
1684   )
1685   * ( braces / ( function ( s ) return LPEG1[lang] : match ( s ) end ) )
1686   * "}"
1687   * Ct ( Cc "Close" )

```

For the command `\alt`, the specification of the overlays (between angular brackets) is mandatory.

```

1688 lpeg = lpeg +
1689   L ( P "\alt" * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{"
1690   * K ( 'ParseAgain.noCR' , braces )
1691   * L ( P "}{" )
1692   * K ( 'ParseAgain.noCR' , braces )
1693   * L ( P "}" )

```

For `\temporal`, the specification of the overlays (between angular brackets) is mandatory.

```

1694 lpeg = lpeg +
1695     L ( ( P "\temporal" ) * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{" )
1696     * K ( 'ParseAgain.noCR' , braces )
1697     * L ( P "}" )
1698     * K ( 'ParseAgain.noCR' , braces )
1699     * L ( P "}" )
1700     * K ( 'ParseAgain.noCR' , braces )
1701     * L ( P "}" )

```

Now, the environments of Beamer.

```

1702 for _ , x in ipairs ( list_beamer_env ) do
1703     lpeg = lpeg +
1704         Ct ( Cc "Open"
1705             * C (
1706                 P ( "\begin{" .. x .. "}" )
1707                 * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1708             )
1709             * Cc ( "\end{" .. x .. "}" )
1710         )
1711     * (
1712         ( ( 1 - P ( "\end{" .. x .. "}" ) ) ^ 0 )
1713         / ( function ( s ) return LPEG1[lang] : match ( s ) end )
1714     )
1715     * P ( "\end{" .. x .. "}" )
1716     * Ct ( Cc "Close" )
1717 end

```

Now, you can return the value we have computed.

```

1718     return lpeg
1719 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

1720 local CommentMath =
1721     P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

EOL The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@_begin_line`: because you want to trigger a special background color for that row (and, after the `\@_begin_line`: it's too late to change de background).

```

1722 local PromptHastyDetection =
1723     ( # ( P ">>>" + "...") * Lc '\@_prompt:' ) ^ -1

```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```

1724 local Prompt = K ( 'Prompt' , ( ( P ">>>" + "...") * P " " ^ -1 ) ^ -1 )

```

The following LPEG EOL is for the end of lines.

```

1725 local EOL =
1726     P "\r"
1727     *
1728     (
1729         ( space ^ 0 * -1 )
1730         +

```

We recall that each line in the Python code we have to parse will be sent back to LaTeX between a pair `\@_begin_line: - @_end_line:`³⁴.

```

1731     Ct (
1732         Cc "EOL"
1733         *
1734         Ct (
1735             Lc "\\@_end_line:"
1736             * BeamerEndEnvironments
1737             * BeamerBeginEnvironments
1738             * PromptHastyDetection
1739             * Lc "\\@_newline: \\@_begin_line:"
1740             * Prompt
1741         )
1742     )
1743 )
1744 * ( SpaceIndentation ^ 0 * # ( 1 - S " \r" ) ) ^ -1

```

The following LPEG `CommentLaTeX` is for what is called in that document the “LaTeX comments”. Since the elements that will be catched must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```

1745 local CommentLaTeX =
1746 P(piton.comment_latex)
1747 * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces"
1748 * L ( ( 1 - P "\r" ) ^ 0 )
1749 * Lc "}"}
1750 * ( EOL + -1 )

```

10.3.1 The language Python

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

1751 local Operator =
1752 K ( 'Operator' ,
1753     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":" + "/" + "**"
1754     + S "--+/*%=<>&.@|")
1755
1756 local OperatorWord =
1757 K ( 'Operator.Word' , P "in" + "is" + "and" + "or" + "not" )
1758
1759 local Keyword =
1760 K ( 'Keyword' ,
1761     P "as" + "assert" + "break" + "case" + "continue" + "def" +
1762     "del" + "elif" + "else" + "except" + "exec" + "finally" + "for" + "from" +
1763     "global" + "if" + "import" + "lambda" + "non local" + "pass" + "return" +
1764     "try" + "while" + "with" + "yield" + "yield from" )
1765 + K ( 'Keyword.Constant' , P "True" + "False" + "None" )
1766
1767 local Builtin =
1768 K ( 'Name.Builtin' ,

1800 "NotADirectoryError" + "PermissionError" + "ProcessLookupError" +
1801 "TimeoutError" + "StopAsyncIteration" + "ModuleNotFoundError" +
1802 "RecursionError" )
1803
1804
1805 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("
1806

```

In Python, a “decorator” is a statement whose begins by @ which patches the function defined in the following statement.

```
1807 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```
1808 local DefClass =
1809 K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be catched as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The following LPEG ImportAs is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style Name.Namespace.

Example: `import numpy as np`

Moreover, after the keyword `import`, it's possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```
1810 local ImportAs =
1811 K ( 'Keyword' , "import" )
1812 * Space
1813 * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
1814 *
1815 ( Space * K ( 'Keyword' , "as" ) * Space
1816     * K ( 'Name.Namespace' , identifier ) )
1817 +
1818 ( SkipSpace * Q "," * SkipSpace
```

```

1819     * K ( 'Name.Namespace' , identifier ) ) ^ 0
1820 )

```

Be careful: there is no commutativity of `+` in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style `Name.Namespace` and the following keyword `import` must be formatted with the piton style `Keyword` and must *not* be caught by the LPEG `ImportAs`.

Example: `from math import pi`

```

1821 local FromImport =
1822   K ( 'Keyword' , "from" )
1823   * Space * K ( 'Name.Namespace' , identifier )
1824   * Space * K ( 'Keyword' , "import" )

```

The strings of Python For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction³⁵ in that interpolation:

```
f'Total price: {total+1:.2f} €'
```

The interpolations beginning by `%` (even though there is more modern technics now in Python).

```

1825 local PercentInterpol =
1826   K ( 'String.Interpol' ,
1827     P "%"
1828     * ( "(" * alphanum ^ 1 * ")" ) ^ -1
1829     * ( S "-#0+" ) ^ 0
1830     * ( digit ^ 1 + "*" ) ^ -1
1831     * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
1832     * ( S "HLL" ) ^ -1
1833     * S "sdfFeExXorgiGauc%"
1834 )

```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function `K` because of the interpolations which must be formatted with another piton style that the rest of the string.³⁶

```

1835 local SingleShortString =
1836   WithStyle ( 'String.Short' ,

```

First, we deal with the f-strings of Python, which are prefixed by `f` or `F`.

```

1837   Q ( P "f!" + "F!" )
1838   *
1839     K ( 'String.Interpol' , "{"
1840     * K ( 'Interpol.Inside' , ( 1 - S "}:" ) ^ 0 )
1841     * Q ( P ":" * ( 1 - S "}:" ) ^ 0 ) ^ -1
1842     * K ( 'String.Interpol' , "}" )

```

³⁵There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

³⁶The interpolations are formatted with the piton style `Interpol.Inside`. The initial value of that style is `\@_piton:n` which means that the interpolations are parsed once again by piton.

```

1843         +
1844         VisualSpace
1845         +
1846         Q ( ( P "\\" + "{{" + "}" ) + 1 - S " {}" ) ^ 1 )
1847     ) ^ 0
1848     * Q """
1849 +
1850 Now, we deal with the standard strings of Python, but also the “raw strings”.
1851     Q ( P "" + "r'" + "R'" )

1944         +
1945         P "%"
1946         +
1947         EOL
1948       ) ^ 0
1949     )
1950     * Q "\\""\\""
1951   )
1952 local LongString = SingleLongString + DoubleLongString
```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG `DefFunction` which deals with the whole preamble of a function definition (which begins with `def`).

```
1953 local StringDoc =
1954   K ( 'String.Doc' , P "r" ^ -1 * "\\"\\\"\\\" )
1955   * ( K ( 'String.Doc' , (1 - P "\\\"\\\" - "r" ) ^ 0 ) * EOL
1956     * Tab ^ 0
1957   ) ^ 0
1958   * K ( 'String.Doc' , ( 1 - P "\\\"\\\" - "r" ) ^ 0 * "\\\"\\\" )
```

The comments in the Python listings We define different LPEG dealing with comments in the Python listings.

```
1959 local Comment =
1960   WithStyle ( 'Comment' ,
1961     Q "#" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
1962     * ( EOL + -1 )
```

DefFunction The following LPEG expression will be used for the parameters in the `argspec` of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```
1963 local expression =
1964   P { "E" ,
1965     E = ( "" * ( P "\\\\" + 1 - S "'\r" ) ^ 0 * """
1966       + "\\" * ( P "\\\\" + 1 - S "\\"r" ) ^ 0 * """
1967       + "{" * V "F" * "}""
1968       + "(" * V "F" * ")"
1969       + "[" * V "F" * "]"
1970       + ( 1 - S "{}()[]\r," ) ^ 0 ,
1971     F = ( "{" * V "F" * "}""
1972       + "(" * V "F" * ")"
1973       + "[" * V "F" * "]"
1974       + ( 1 - S "{}()[]\r\""" ) ^ 0
1975 }
```

We will now define a LPEG `Params` that will catch the list of parameters (that is to say the `argspec`) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG `Params` will be used to catch the chunk `a,b,x=10,n:int`.

```
1976 local Params =
1977   P { "E" ,
1978     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
1979     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
1980     * (
1981       K ( 'InitialValues' , "=" * expression )
1982       + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
1983     ) ^ -1
1984 }
```

The following LPEG `DefFunction` catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as `Comment`, `CommentLaTeX`, `Params`, `StringDoc`...

```
1985 local DefFunction =
1986   K ( 'Keyword' , "def" )
1987   * Space
```

```

1988 * K ( 'Name.Function.Internal' , identifier )
1989 * SkipSpace
1990 * Q "(" * Params * Q ")"
1991 * SkipSpace
1992 * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1

```

Here, we need a `piton` style `ParseAgain` which will be linked to `\@_piton:n` (that means that the capture will be parsed once again by `piton`). We could avoid that kind of trick by using a non-terminal of a grammar but we have probably here a better legibility.

```

1993 * K ( 'ParseAgain.noCR' , ( 1 - S ":\r" ) ^ 0 )
1994 * Q ":""
1995 * ( SkipSpace
1996     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
1997     * Tab ^ 0
1998     * SkipSpace
1999     * StringDoc ^ 0 -- there may be additionnal docstrings
2000 ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` *must* appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be catched as keyword by the LPEG Keyword (useful if, for example, the final user wants to speak of the keyword `def`).

Miscellaneous

```
2001 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL
```

The main LPEG for the language Python First, the main loop :

```

2002 local Main =
2003     space ^ 1 * -1
2004     + space ^ 0 * EOL
2005     + Space
2006     + Tab
2007     + Escape + EscapeMath
2008     + CommentLaTeX
2009     + Beamer
2010     + DetectedCommands
2011     + LongString
2012     + Comment
2013     + ExceptionInConsole
2014     + Delim
2015     + Operator
2016     + OperatorWord * ( Space + Punct + Delim + EOL + -1 )
2017     + ShortString
2018     + Punct
2019     + FromImport
2020     + RaiseException
2021     + DefFunction
2022     + DefClass
2023     + Keyword * ( Space + Punct + Delim + EOL + -1 )
2024     + Decorator
2025     + Builtin * ( Space + Punct + Delim + EOL + -1 )
2026     + Identifier
2027     + Number
2028     + Word

```

Here, we must not put `local!`

```
2029 LPEG1['python'] = Main ^ 0
```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@_begin_line: - \@_end_line:`³⁷.

```

2030 LPEG2['python'] =
2031   Ct (
2032     ( space ^ 0 * "\r" ) ^ -1
2033     * BeamerBeginEnvironments
2034     * PromptHastyDetection
2035     * Lc '\@_begin_line:'
2036     * Prompt
2037     * SpaceIndentation ^ 0
2038     * LPEG1['python']
2039     * -1
2040     * Lc '\@_end_line:'
2041   )

```

10.3.2 The language Ocaml

```

2042 local Delim = Q ( P "[" + "]" + S "[()]" )
2043 local Punct = Q ( S ",;!" )

```

The identifiers catched by `cap_identifier` begin with a cap. In OCaml, it's used for the constructors of types and for the modules.

```

2044 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2045 local Constructor = K ( 'Name.Constructor' , cap_identifier )
2046 local ModuleType = K ( 'Name.Type' , cap_identifier )

```

The identifiers which begin with a lower case letter or an underscore are used elsewhere in OCaml.

```

2047 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2048 local Identifier = K ( 'Identifier' , identifier )

```

Now, we deal with the records because we want to catch the names of the fields of those records in all circumstances.

```

2049 local expression_for_fields =
2050   P { "E" ,
2051     E = (   "{" * V "F" * "}"
2052           + "(" * V "F" * ")"
2053           + "[" * V "F" * "]"
2054           + "\\" * ( P "\\\\" + 1 - S "\r" ) ^ 0 * "\\" "
2055           + "''" * ( P "\\'" + 1 - S "'\r" ) ^ 0 * "'"
2056           + ( 1 - S "{}[]\r;" ) ) ^ 0 ,
2057     F = (   "{" * V "F" * "}"
2058           + "(" * V "F" * ")"
2059           + "[" * V "F" * "]"
2060           + ( 1 - S "{}[]\r''" ) ) ^ 0
2061   }
2062 local OneFieldDefinition =
2063   ( K ( 'Keyword' , "mutable" ) * SkipSpace ) ^ -1
2064   * K ( 'Name.Field' , identifier ) * SkipSpace
2065   * Q ":" * SkipSpace
2066   * K ( 'Name.Type' , expression_for_fields )
2067   * SkipSpace
2068
2069 local OneField =
2070   K ( 'Name.Field' , identifier ) * SkipSpace
2071   * Q "=" * SkipSpace
2072   * ( expression_for_fields
2073     / ( function ( s ) return LPEG1['ocaml'] : match ( s ) end )
2074   )
2075   * SkipSpace

```

³⁷Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

```

2076
2077 local Record =
2078   Q "{" * SkipSpace
2079   *
2080   (
2081     OneFieldDefinition * ( Q ";" * SkipSpace * OneFieldDefinition ) ^ 0
2082     +
2083     OneField * ( Q ";" * SkipSpace * OneField ) ^ 0
2084   )
2085   *
2086   Q "}"

```

Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

2087 local DotNotation =
2088   (
2089     K ( 'Name.Module' , cap_identifier )
2090     * Q "."
2091     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{"
2092     +
2093     Identifier
2094     * Q "."
2095     * K ( 'Name.Field' , identifier )
2096   )
2097   * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0
2098 local Operator =
2099   K ( 'Operator' ,
2100     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":=" + "|"
2101     + "//" + "***" + ";" + ":" + "->" + "+" + "-" + "*." + "/"
2102     + S "-~+/*%=<>&@|"
2103
2104 local OperatorWord =
2105   K ( 'Operator.Word' ,
2106     P "and" + "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" )
2107
2108 local Keyword =
2109   K ( 'Keyword' ,
2110     P "assert" + "and" + "as" + "begin" + "class" + "constraint" + "done"
2111     + "downto" + "do" + "else" + "end" + "exception" + "external" + "for"
2112     + "function" + "functor" + "fun" + "if" + "include" + "inherit" + "initializer"
2113     + "in" + "lazy" + "let" + "match" + "method" + "module" + "mutable" + "new"
2114     + "object" + "of" + "open" + "private" + "raise" + "rec" + "sig" + "struct"
2115     + "then" + "to" + "try" + "type" + "value" + "val" + "virtual" + "when"
2116     + "while" + "with" )
2117   + K ( 'Keyword.Constant' , P "true" + "false" )
2118
2119 local Builtin =
2120   K ( 'Name.Builtin' , P "not" + "incr" + "decr" + "fst" + "snd" )

```

The following exceptions are exceptions in the standard library of OCaml (Stdlib).

```

2121 local Exception =
2122   K ( 'Exception' ,
2123     P "Division_by_zero" + "End_of_File" + "Failure" + "Invalid_argument" +
2124     "Match_failure" + "Not_found" + "Out_of_memory" + "Stack_overflow" +
2125     "Sys_blocked_io" + "Sys_error" + "Undefined_recursive_module" )

```

The characters in OCaml

```

2126 local Char =
2127   K ( 'String.Short' , "" * ( ( 1 - P "" ) ^ 0 + "\\" ) * "" )

```

Beamer

```

2128 braces = Compute_braces ( "\\" * ( 1 - S "\\" ) ^ 0 * "\\" )
2129 if piton.beamer then
2130   Beamer = Compute_Beamer ( 'ocaml' , "\\" * ( 1 - S "\\" ) ^ 0 * "\\" )
2131 end
2132 DetectedCommands = Compute_DetectedCommands ( 'ocaml' , braces )

2133 LPEG_cleaner['ocaml'] = Compute_LPEG_cleaner ( 'ocaml' , braces )

```

The strings en OCaml We need a pattern `ocaml_string` without captures because it will be used within the comments of OCaml.

```

2134 local ocaml_string =
2135   Q "\\"
2136   *
2137     VisualSpace
2138     +
2139     Q ( ( 1 - S "\\r" ) ^ 1 )
2140     +
2141     EOL
2142   ) ^ 0
2143   * Q "\\"
2144 local String = WithStyle ( 'String.Long' , ocaml_string )

```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua's long strings* in www.inf.puc-rio.br/~roberto/lpeg.

```

2145 local ext = ( R "az" + "_" ) ^ 0
2146 local open = "{" * Cg ( ext , 'init' ) * "|"
2147 local close = "|" * C ( ext ) * "}"
2148 local closeeq =
2149   Cmt ( close * Cb ( 'init' ) ,
2150         function ( s , i , a , b ) return a == b end )

```

The `LPEG_QuotedStringBis` will do the second analysis.

```

2151 local QuotedStringBis =
2152   WithStyle ( 'String.Long' ,
2153   (
2154     Space
2155     +
2156     Q ( ( 1 - S "\\r" ) ^ 1 )
2157     +
2158     EOL
2159   ) ^ 0 )

```

We use a “function capture” (as called in the official documentation of the `LPEG`) in order to do the second analysis on the result of the first one.

```

2160 local QuotedString =
2161   C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2162   ( function ( s ) return QuotedStringBis : match ( s ) end )

```

The comments in the OCaml listings In OCaml, the delimiters for the comments are (* and *). There are unsymmetrical and OCaml allows those comments to be nested. That's why we need a grammar.

In these comments, we embed the math comments (between \$ and \$) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

2163 local Comment =
2164   WithStyle ( 'Comment' ,
2165     P {
2166       "A" ,
2167       A = Q "(*"
2168         * ( V "A"
2169           + Q ( ( 1 - S "\r$\" - "(*" - "*") ) ^ 1 ) -- $
2170           + ocaml_string
2171           + $" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * $" -- $
2172           + EOL
2173         ) ^ 0
2174         * Q "*)"
2175     }
2176 )

```

The DefFunction

```

2176 local balanced_parens =
2177   P { "E" , E = ( "(" * V "E" * ")" + 1 - S "()" ) ^ 0 }

2178 local Argument =
2179   K ( 'Identifier' , identifier )
2180   + Q "(" * SkipSpace
2181     * K ( 'Identifier' , identifier ) * SkipSpace
2182     * Q ":" * SkipSpace
2183     * K ( 'Name.Type' , balanced_parens ) * SkipSpace
2184     * Q ")"

```

Despite its name, then LPEG DefFunction deals also with let open which opens locally a module.

```

2185 local DefFunction =
2186   K ( 'Keyword' , "let open" )
2187   * Space
2188   * K ( 'Name.Module' , cap_identifier )
2189   +
2190   K ( 'Keyword' , P "let rec" + "let" + "and" )
2191   * Space
2192   * K ( 'Name.Function.Internal' , identifier )
2193   * Space
2194   * (

2311   K ( 'Name.Type' ,
2312     P "bool" + "char" + "char16_t" + "char32_t" + "double" + "float" + "int" +

```

³⁸Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2313     "int8_t" + "int16_t" + "int32_t" + "int64_t" + "long" + "short" + "signed"
2314     + "unsigned" + "void" + "wchar_t" ) * Q "*" ^ 0
2315
2316 local DefFunction =
2317   Type
2318   * Space
2319   * Q "*" ^ -1
2320   * K ( 'Name.Function.Internal' , identifier )
2321   * SkipSpace
2322   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```

2323 local DefClass =
2324   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be catched as keyword by the LPEG `Keyword` (useful if we want to type a list of keywords).

The strings of C

```

2325 String =
2326   WithStyle ( 'String.Long' ,
2327     Q "\""
2328     * ( VisualSpace
2329       + K ( 'String.Interpol' ,
2330         "%" * ( S "difcspxXou" + "ld" + "li" + "hd" + "hi" )
2331       )
2332       + Q ( ( P "\\\\" + 1 - S " \"\\"" ) ^ 1 )
2333     ) ^ 0
2334   * Q "\""
2335 )

```

Beamer

```

2336 braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2337 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
2338 DetectedCommands = Compute_DetectedCommands ( 'c' , braces )
2339 LPEG_cleaner['c'] = Compute_LPEG_cleaner ( 'c' , braces )

```

The directives of the preprocessor

```

2340 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )

```

The comments in the C listings We define different LPEG dealing with comments in the C listings.

```

2341 local Comment =
2342   WithStyle ( 'Comment' ,
2343     Q("//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2344     * ( EOL + -1 )
2345
2346 local LongComment =
2347   WithStyle ( 'Comment' ,
2348     Q("/*"
2349       * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2350       * Q "*/"
2351     ) -- $

```

The main LPEG for the language C First, the main loop :

```

2352 local Main =
2353     space ^ 1 * -1
2354     + space ^ 0 * EOL
2355     + Space
2356     + Tab
2357     + Escape + EscapeMath
2358     + CommentLaTeX
2359     + Beamer
2360     + DetectedCommands
2361     + Preproc
2362     + Comment + LongComment
2363     + Delim
2364     + Operator
2365     + String
2366     + Punct
2367     + DefFunction
2368     + DefClass
2369     + Type * ( Q "*" ^ -1 + Space + Punct + Delim + EOL + -1 )
2370     + Keyword * ( Space + Punct + Delim + EOL + -1 )
2371     + Builtin * ( Space + Punct + Delim + EOL + -1 )
2372     + Identifier
2373     + Number
2374     + Word

```

Here, we must not put `local!`

```

2375 LPEG1['c'] = Main ^ 0

```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@_begin_line: - @_end_line:`³⁹.

```

2376 LPEG2['c'] =
2377 Ct (
2378     ( space ^ 0 * P "\r" ) ^ -1
2379     * BeamerBeginEnvironments
2380     * Lc '\\@_begin_line:'
2381     * SpaceIndentation ^ 0
2382     * LPEG1['c']
2383     * -1
2384     * Lc '\\@_end_line:'
2385 )

```

10.3.4 The language SQL

```

2386 local function LuaKeyword ( name )
2387 return
2388 Lc [[{\PitonStyle{Keyword}{}}
2389 * Q ( Cmt (
2390     C ( identifier ) ,
2391     function ( s , i , a ) return string.upper ( a ) == name end
2392 )
2393 )
2394 * Lc "}"")]
2395 end

```

In the identifiers, we will be able to catch those containing spaces, that is to say like "`last name`".

```

2396 local identifier =
2397     letter * ( alphanum + "-" ) ^ 0

```

³⁹Remember that the `\@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@_begin_line:`

```

2398     + '!" * ( ( alphanum + space - '!" ) ^ 1 ) * '!"
2399
2400
2401 local Operator =
2402 K ( 'Operator' , P "!=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*+/" )
In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch
the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However,
some keywords will be caught in special LPEG because we want to detect the names of the SQL
tables.
2403 local function Set ( list )
2404     local set = { }
2405     for _, l in ipairs ( list ) do set[l] = true end
2406     return set
2407 end
2408
2409 local set_keywords = Set
2410 {
2411     "ADD" , "AFTER" , "ALL" , "ALTER" , "AND" , "AS" , "ASC" , "BETWEEN" , "BY" ,
2412     "CHANGE" , "COLUMN" , "CREATE" , "CROSS JOIN" , "DELETE" , "DESC" , "DISTINCT" ,
2413     "DROP" , "FROM" , "GROUP" , "HAVING" , "IN" , "INNER" , "INSERT" , "INTO" , "IS" ,

2590 % \subsubsection{The function Parse}
2591 %
2592 % \medskip
2593 % The function |Parse| is the main function of the package \pkg{piton}. It
2594 % parses its argument and sends back to LaTeX the code with interlaced
2595 % formatting LaTeX instructions. In fact, everything is done by the
2596 % \textsc{lpeg} corresponding to the considered language (|LPEG2[language]|)
2597 % which returns as capture a Lua table containing data to send to LaTeX.
2598 %
2599 % \bigskip
2600 % \begin{macrocode}
2601 function piton.Parse ( language , code )
2602     local t = LPEG2[language] : match ( code )
2603     if t == nil
2604     then
2605         sprintL3 [[ \@@_error_or_warning:n { syntax-error } ]]
2606         return -- to exit in force the function
2607     end
2608     local left_stack = {}
2609     local right_stack = {}

```

```

2610   for _, one_item in ipairs ( t ) do
2611     if one_item[1] == "EOL" then
2612       for _, s in ipairs ( right_stack ) do
2613         tex.sprint ( s )
2614       end
2615       for _, s in ipairs ( one_item[2] ) do
2616         tex.tprint ( s )
2617       end
2618       for _, s in ipairs ( left_stack ) do
2619         tex.sprint ( s )
2620       end
2621     else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}<2>" , "\end{cover}" }
```

In order to deal with the ends of lines, we have to close the environment (`\begin{cover}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}<2>` and `right_stack` will be for the elements like `\end{cover}`.

```

2622     if one_item[1] == "Open" then
2623       tex.sprint( one_item[2] )
2624       table.insert ( left_stack , one_item[2] )
2625       table.insert ( right_stack , one_item[3] )
2626     else
2627       if one_item[1] == "Close" then
2628         tex.sprint ( right_stack[#right_stack] )
2629         left_stack[#left_stack] = nil
2630         right_stack[#right_stack] = nil
2631       else
2632         tex.tprint ( one_item )
2633       end
2634     end
2635   end
2636 end
2637 end

```

The function `ParseFile` will be used by the LaTeX command `\PitonInputfile`. That function merely reads the file (between `first_line` and `last_line`) and then apply the function `Parse` to the resulting Lua string.

```

2638 function piton.ParseFile ( language , name , first_line , last_line , split )
2639   local s = ''
2640   local i = 0
2641   for line in io.lines ( name ) do
2642     i = i + 1
2643     if i >= first_line then
2644       s = s .. '\r' .. line
2645     end
2646     if i >= last_line then break end
2647   end

```

We extract the BOM of utf-8, if present.

```

2648   if string.byte ( s , 1 ) == 13 then
2649     if string.byte ( s , 2 ) == 239 then
2650       if string.byte ( s , 3 ) == 187 then
2651         if string.byte ( s , 4 ) == 191 then
2652           s = string.sub ( s , 5 , -1 )
2653         end
2654       end
2655     end
2656   end
2657   if split == 1 then
2658     piton.GobbleSplitParse ( language , 0 , s )
2659   else
2660     sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]

```

```

2661     piton.Parse ( language , s )
2662     sprintL3
2663     [[\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]
2664   end
2665 end

```

10.3.6 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols #.

```

2666 function piton.ParseBis ( lang , code )
2667   local s = ( Cs ( ( P '#' / '#' + 1 ) ^ 0 ) ) : match ( code )
2668   return piton.Parse ( lang , s )
2669 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the piton style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```
2670 function piton.ParseTer ( lang , code )
```

Be careful: we have to write `[\@@_breakable_space:]` with a space after the name of the LaTeX command `\@@_breakable_space:`.

```

2671   local s = ( Cs ( ( P [\@@_breakable_space: ] / ' ' + 1 ) ^ 0 ) )
2672         : match ( code )
2673   return piton.Parse ( lang , s )
2674 end

```

10.3.7 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```

2675 local AutoGobbleLPEG =
2676   (
2677     P " " ^ 0 * "\r"
2678     +
2679     Ct ( C " " ^ 0 ) / table.getn
2680     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
2681   ) ^ 0
2682   * ( Ct ( C " " ^ 0 ) / table.getn
2683     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2684 ) / math.min

```

The following LPEG is similar but works with the tabulations.

```

2685 local TabsAutoGobbleLPEG =
2686   (
2687     (
2688       P "\t" ^ 0 * "\r"
2689       +
2690       Ct ( C "\t" ^ 0 ) / table.getn
2691       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
2692     ) ^ 0
2693     * ( Ct ( C "\t" ^ 0 ) / table.getn
2694       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2695 ) / math.min

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditionnal way to indent in LaTeX).

```

2696 local EnvGobbleLPEG =
2697   ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
2698   * Ct ( C " " ^ 0 * -1 ) / table.getn
2699 local function remove_before_cr ( input_string )
2700   local match_result = ( P "\r" ) : match ( input_string )
2701   if match_result then
2702     return string.sub ( input_string , match_result )
2703   else
2704     return input_string
2705   end
2706 end

```

The function `gobble` gobbles n characters on the left of the code. The negative values of n have special significations.

```

2707 local function gobble ( n , code )
2708   code = remove_before_cr ( code )
2709   if n == 0 then
2710     return code
2711   else
2712     if n == -1 then
2713       n = AutoGobbleLPEG : match ( code )
2714     else
2715       if n == -2 then
2716         n = EnvGobbleLPEG : match ( code )
2717       else
2718         if n == -3 then
2719           n = TabsAutoGobbleLPEG : match ( code )
2720         end
2721       end
2722     end

```

We have a second test `if n == 0` because the, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

2723   if n == 0 then
2724     return code
2725   else

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of n .

```

2726   return
2727   ( Ct (
2728     ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2729     * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2730     ) ^ 0 )
2731     / table.concat
2732   ) : match ( code )
2733   end
2734 end
2735 end

```

In the following code, n is the value of `\l_@@_gobble_int`.

```

2736 function piton.GobbleParse ( lang , n , code )
2737   piton.last_code = gobble ( n , code )
2738   piton.last_language = lang
2739   sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]
2740   piton.Parse ( lang , piton.last_code )
2741   sprintL3
2742   [[\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]

```

Now, if the final user has used the key `write` to write the code of the environment on an external file.

```
2743 if piton.write and piton.write ~= '' then
2744   local file = assert ( io.open ( piton.write , piton.write_mode ) )
2745   file:write ( piton.get_last_code ( ) )
2746   file:close ( )
2747 end
2748 end
```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the informatic code is split in chunks at the empty lines (usually between the informatic functions defined in the informatic code). LaTeX will be able to change the page between the chunks.

```
2749 function piton.GobbleSplitParse ( lang , n , code )
2750   P { "E" ,
2751     E = ( V "F"
2752       * ( P " " ^ 0 * "\r"
2753         / ( function ( x ) sprintL3 [[ \@@_incr_visual_line: ]] end )
2754         ) ^ 1
2755       / ( function ( x )
2756         sprintL3 [[ \l_@@_split_separation_tl \int_gzero:N \g_@@_line_int ]]
2757         end )
2758       ) ^ 0 * V "F" ,
```

The non-terminal F corresponds to a chunk of the informatic code.

```
2759   F = C ( V "G" ^ 0 )
```

The second argument of `.pitonGobbleParse` is the argument `gobble`: we put that argument to 0 because we will have gobbled previously the whole argument `code` (see below).

```
2760   / ( function ( x ) piton.GobbleParse ( lang , 0 , x ) end ) ,
```

The non-terminal G corresponds to a non-empty line of code.

```
2761   G = ( 1 - P "\r" ) ^ 0 * "\r" - ( P " " ^ 0 * "\r" )
2762   } : match ( gobble ( n , code ) )
2763 end
```

The following public Lua function is provided to the developer.

```
2764 function piton.get_last_code ( )
2765   return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
2766 end
```

10.3.8 To count the number of lines

```
2767 function piton.CountLines ( code )
2768   local count = 0
2769   for i in code : gmatch ( "\r" ) do count = count + 1 end
2770   sprintL3 ( [[ \int_set:Nn \l_@@_nb_lines_int { }] .. count .. '}' )
2771 end

2772 function piton.CountNonEmptyLines ( code )
2773   local count = 0
2774   count =
2775     ( Ct ( ( P " " ^ 0 * "\r"
2776       + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
2777       * ( 1 - P "\r" ) ^ 0
2778       * -1
2779     ) / table.getn
2780   ) : match ( code )
2781   sprintL3 ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { }] .. count .. '}' )
2782 end

2783 function piton.CountLinesFile ( name )
```

```

2784 local count = 0
2785 for line in io.lines ( name ) do count = count + 1 end
2786 sprintL3 ( [[ \int_set:Nn \l_@@_nb_lines_int { }] .. count .. '}' )
2787 end

2788 function piton.CountNonEmptyLinesFile ( name )
2789 local count = 0
2790 for line in io.lines ( name )
2791 do if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
2792 count = count + 1
2793 end
2794 end
2795 sprintL3 ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { }] .. count .. '}' )
2796 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```

2797 function piton.ComputeRange(marker_beginning,marker_end,file_name)
2798 local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
2799 local t = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
2800 local first_line = -1
2801 local count = 0
2802 local last_found = false
2803 for line in io.lines ( file_name )
2804 do if first_line == -1
2805 then if string.sub ( line , 1 , #s ) == s
2806 then first_line = count
2807 end
2808 else if string.sub ( line , 1 , #t ) == t
2809 then last_found = true
2810 break
2811 end
2812 end
2813 count = count + 1
2814 end
2815 if first_line == -1
2816 then sprintL3 [[ \@@_error_or_warning:n { begin~marker~not~found } ]]
2817 else if last_found == false
2818 then sprintL3 [[ \@@_error_or_warning:n { end~marker~not~found } ]]
2819 end
2820 end
2821 sprintL3 (
2822 [[ \int_set:Nn \l_@@_first_line_int { }] .. first_line .. ' + 2 }]
2823 .. [[ \int_set:Nn \l_@@_last_line_int { }] .. count .. '}' )
2824 end

```

10.3.9 To create new languages with the syntax of listings

```

2825 function piton.new_language ( lang , definition )
2826 lang = string.lower ( lang )

2827 local alpha , digit = lpeg.alpha , lpeg.digit
2828 local letter = alpha + S "@_$" -- $

```

In the following LPEG we have a problem when we try to add `{` and `}`.

```

2829 local other = S "+-*<>!?:;.()@[]~^=#&\"\\\$" -- $

2830 function add_to_letter ( c )
2831 if c ~= " " then letter = letter + c end
2832 end
2833 function add_to_digit ( c )

```

```

2834     if c ~= " " then digit = digit + c end
2835 end

```

Of course, the LPEG `strict_braces` is for balanced braces (without the question of strings of an informatic language). In fact, it *won't* be used for an informatic language (as dealt by piton) but for LaTeX instructions;

```

2836 local strict_braces =
2837   P { "E" ,
2838     E = ( "{" * V "F" * "}" + ( 1 - S ",{}" ) ) ^ 0 ,
2839     F = ( "{" * V "F" * "}" + ( 1 - S "{}" ) ) ^ 0
2840   }

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument `definition` of `piton.new_language`.

```

2841 local cut_definition =
2842   P { "E" ,
2843     E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
2844     F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
2845               * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
2846   }
2847 local def_table = cut_definition : match ( definition )

```

The definition of the language, provided by the final user of piton is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

2848 local tex_braced_arg = "{" * C ( ( 1 - P "}" ) ^ 0 ) * "}"
2849 local tex_arg = tex_braced_arg + C ( 1 )
2850 local tex_option_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]" + Cc ( nil )
2851 local args_for_tag
2852   = tex_option_arg
2853   * space ^ 0
2854   * tex_arg
2855   * space ^ 0
2856   * tex_arg
2857 local args_for_morekeywords
2858   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2859   * space ^ 0
2860   * tex_option_arg
2861   * space ^ 0
2862   * tex_arg
2863   * space ^ 0
2864   * ( tex_braced_arg + Cc ( nil ) )
2865 local args_for_moredelims
2866   = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
2867   * args_for_morekeywords
2868 local args_for_morecomment
2869   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2870   * space ^ 0
2871   * tex_option_arg
2872   * space ^ 0
2873   * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

2874 local sensitive = true
2875 local style_tag , left_tag , right_tag
2876 for _ , x in ipairs ( def_table ) do
2877   if x[1] == "sensitive" then

```

```

2878     if x[2] == nil or ( P "true" ) : match ( x[2] ) then
2879         sensitive = true
2880     else
2881         if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
2882     end
2883   end
2884   if x[1] == "alsodigit" then x[2] : gsub ( "." , add_to_digit ) end
2885   if x[1] == "alsoletter" then x[2] : gsub ( "." , add_to_letter ) end
2886   if x[1] == "tag" then
2887     style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
2888     style_tag = style_tag or [[\PitonStyle{Tag}]]
2889   end
2890 end

```

Now, the LPEG for the numbers. Of course, it uses digit previously computed.

```

2891 local Number =
2892   K ( 'Number' ,
2893     ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
2894       + digit ^ 0 * "." * digit ^ 1
2895       + digit ^ 1 )
2896     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
2897       + digit ^ 1
2898   )
2899 local alphanum = letter + digit
2900 local identifier = letter * alphanum ^ 0
2901 local Identifier = K ( 'Identifier' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

2902 local split_clist =
2903   P { "E" ,
2904     E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1
2905       * ( P "{" ) ^ 1
2906       * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
2907       * ( P "}" ) ^ 1 * space ^ 0 ,
2908     F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
2909   }

```

The following function will be used if the keywords are not case-sensitive.

```

2910 local function keyword_to_lpeg ( name )
2911   return
2912   Q ( Cmt (
2913     C ( identifier ) ,
2914     function(s,i,a) return string.upper(a) == string.upper(name) end
2915   )
2916 )
2917 end
2918 local Keyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

2919 for _ , x in ipairs ( def_table )
2920 do if x[1] == "morekeywords"
2921   or x[1] == "otherkeywords"
2922   or x[1] == "moredirectives"
2923   or x[1] == "moretexcs"
2924 then
2925   local keywords = P ( false )
2926   local style = [[\PitonStyle{Keyword}]]
2927   if x[1] == "moredirectives" then style = [[ \PitonStyle{Directive} ]] end
2928   style = tex_option_arg : match ( x[2] ) or style
2929   local n = tonumber ( style )
2930   if n then
2931     if n > 1 then style = [[\PitonStyle{Keyword}]] .. style .. "}" end
2932   end

```

```

2933     for _, word in ipairs ( split_clist : match ( x[2] ) ) do
2934         if x[1] == "moretexcs" then
2935             keywords = Q ( [[\]] .. word ) + keywords
2936         else
2937             if sensitive
2938                 then keywords = Q ( word ) + keywords
2939                 else keywords = keyword_to_lpeg ( word ) + keywords
2940             end
2941         end
2942     end
2943     Keyword = Keyword +
2944     Lc ( "{" .. style .. "{" * keywords * Lc "}" }"
2945   end
2946   if x[1] == "keywordsprefix" then
2947       local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
2948       Keyword = Keyword + K ( 'Keyword' , P ( prefix ) * alphanum ^ 0 )
2949   end
2950 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

2951 local long_string = P ( false )
2952 local LongString = P ( false )
2953 local central_pattern = P ( false )
2954 for _, x in ipairs ( def_table ) do
2955     if x[1] == "morestring" then
2956         arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
2957         arg2 = arg2 or [[\PitonStyle{String.Long}]]
2958         if arg1 ~= "s" then
2959             arg4 = arg3
2960         end
2961         central_pattern = 1 - S ( " \r" .. arg4 )
2962         if arg1 : match "b" then
2963             central_pattern = P ( [[\]] .. arg3 ) + central_pattern
2964         end

```

In fact, the specifier `d` is point-less: when it is not in force, it's still possible to double the delimiter with a correct behaviour of piton since, in that case, piton will compose *two* contiguous strings...

```

2965     if arg1 : match "d" or arg1 == "m" then
2966         central_pattern = P ( arg3 .. arg3 ) + central_pattern
2967     end
2968     if arg1 == "m"
2969         then prefix = lpeg.B ( 1 - letter - ")" - "]")
2970         else prefix = P ( true )
2971     end

```

We can write the pattern which matches the string.

```

2972 local pattern =
2973     prefix
2974     * Q ( arg3 )
2975     * ( VisualSpace + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
2976     * Q ( arg4 )

```

First, we create `long_string` because we need that LPEG in the nested comments.

```

2977     long_string = long_string + pattern
2978     LongString = LongString +
2979         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "{" * Cc "}" }" )
2980         * pattern
2981         * Ct ( Cc "Close" )
2982     end
2983 end
2984

```

```

2985 local braces = Compute_braces ( String )
2986 if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
2987
2988 DetectedCommands = Compute_DetectedCommands ( lang , braces )
2989
2990 LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )

```

Now, we deal with the comments and the delims.

```

2991 local CommentDelim = P ( false )
2992
2993 for _ , x in ipairs ( def_table ) do
2994   if x[1] == "morecomment" then

11 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension piton is done on the following GitHub repository:

<https://github.com/fpantigny/piton>

Changes between versions 2.8 and 3.0

New command `\NewPitonLanguage`. Thanks to that command, it's now possible to define new informatic languages with the syntax used by `listings`. Therefore, it's possible to say that virtually all the informatic languages are now supported by piton.

Changes between versions 2.7 and 2.8

The key `path` now accepts a *list* of pathes where the files to include will be searched.
New commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF`.

Changes between versions 2.6 and 2.7

New keys `split-on-empty-lines` and `split-separation`

Changes between versions 2.5 and 2.6

API: `piton.last_code` and `\g_piton_last_code_tl` are provided.

Changes between versions 2.4 and 2.5

New key `path-write`

Changes between versions 2.3 and 2.4

The key `identifiers` of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

Changes between versions 2.2 and 2.3

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

Changes between versions 2.1 and 2.2

New key `path` for `\PitonOptions`.

New language SQL.

It's now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.

Changes between versions 1.6 and 2.0

The extension `piton` now supports the computer languages OCaml and C (and, of course, Python).

Changes between versions 1.5 and 1.6

New key `width` (for the total width of the listing).

New style `UserFunction` to format the names of the Python functions previously defined by the user.

Command `\PitonClearUserFunctions` to clear the list of such functions names.

Changes between versions 1.4 and 1.5

New key `numbers-sep`.

Changes between versions 1.3 and 1.4

New key `identifiers` in `\PitonOptions`.

New command `\PitonStyle`.

`background-color` now accepts as value a *list* of colors.

Changes between versions 1.2 and 1.3

When the class `Beamer` is used, the environment `{Piton}` and the command `\PitonInputFile` are “overlay-aware” (that is to say, they accept a specification of overlays between angular brackets).

New key `prompt-background-color`

It's now possible to use the command `\label` to reference a line of code in an environment `{Piton}`.

A new command `_` is available in the argument of the command `\piton{...}` to insert a space (otherwise, several spaces are replaced by a single space).

Changes between versions 1.1 and 1.2

New keys `break-lines-in-piton` and `break-lines-in-Piton`.

New key `show-spaces-in-string` and modification of the key `show-spaces`.

When the class `beamer` is used, the environements `{uncoverenv}`, `{onlyenv}`, `{visibleenv}` and `{invisibleref}`

Changes between versions 1.0 and 1.1

The extension `piton` detects the class `beamer` and activates the commands `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` in the environments `{Piton}` when the class `beamer` is used.
