Package 'Orcs'

October 12, 2022

Title Omnidirectional R Code Snippets

Version 1.2.2

Maintainer Florian Detsch <fdetsch@web.de>

Description I tend to repeat the same code chunks over and over again. At first, this was fine for me and I paid little attention to such redundancies. A little later, when I got tired of manually replacing Linux filepaths with the referring Windows versions, and vice versa, I started to stuff some very frequently used work-steps into functions and, even later, into a proper R package. And that's what this package is - a hodgepodge of various R functions meant to simplify (my) everyday-life coding work without, at the same time, being devoted to a particular scope of application.

R topics documented:

`Orcs-package` *Omnidirectional R Code Snippets.*

Description

Omnidirectional R Code Snippets

Details

The package provides a variety of functions which I regularly use during my everyday work.

Author(s)

Florian Detsch, Tim Appelhans, Baptiste Auguie, OpenStreetMap contributors

Maintainer: Florian Detsch <fdetsch@web.de>

`assignSSH` *Assign SSH Key to Local Git Repository*

Description

Assign an SSH key to a local Git repository to bypass user/password prompts during 'git push. See Generating an SSH Key for further information on how to generate an SSH key and add it to your GitHub account.

Usage

```
assignSSH(user, repo)
```

Arguments

`user`	GitHub user name as `character`. If not specified, information on GitHub user and repository name is taken from the current working environment.
`repo`	GitHub repository name as `character`, see 'user'.

See Also

https://docs.github.com/articles/generating-an-ssh-key/.

Examples

```
## Not run:
## for an arbitrary git repository
assignSSH()

## for this very git repository
assignSSH(user = "fdetsch", repo = "Orcs")

## End(Not run)
```

buildBook *Build a Book without Underscores*

Description

Since the use of underscores ('_') is not permitted when streaming **bookdown** documents via GitHub Pages, this wrapper function serves to remove any unwanted underscores from subfolders and link `.html` documents created by `bookdown::render_book()`.

Usage

```
buildBook(output_dir = "book", ...)
```

Arguments

`output_dir`	Output directory as `character`.
`...`	Arguments passed to `bookdown::render_book()`.

Note

While all remaining arguments passed to `bookdown::render_book()` remain untouched, and hence their specification is freely up to the user, the default value of 'output_dir' is explicitly set to `"book"` here. If this were not the case (i.e. if the default value were used), the output document would be created in `"_book"` which is not desirable for obvious reasons.

Author(s)

Florian Detsch

bumpVersion *Bump Package 'Version:' and 'Date:' in DESCRIPTION File*

Description

This function let's you bump the version number and creation date of your package's `DESCRIPTION` file. Additionally, it bumps the version numbers of a `NEWS.md` file and automatically generates a corresponding plain NEWS file (for R-help pages). Supported versioning system is MAJOR.MINOR.PATCH.

Usage

```
bumpVersion(
  element = "patch",
  pkg.repo = ".",
  news = file.path(pkg.repo, "NEWS.md"),
  plain_news = TRUE
)
```

Arguments

element	character, one of "major", "minor", "patch" (default) to be bumped.
pkg.repo	Path to package repository folder. Default is current working directory, i.e. ".".
news	The NEWS.md file of the repo (assumed to be in top level path). If this exists, the first line of that file will be rewritten to be "\<packagename\> \<major.minor.patch\>". Note that the current implementation assumes that the NEWS file is in .md format. A plain NEWS file (for R-help pages) will be generated automatically.
plain_news	whether to generate a plain NEWS file in the package root directory from the NEWS.md file supplied to argument 'news'.

---

compareDistributions *Compare Two Density Distributions Side by Side*

Description

This function will produce a plot of two density functions displayed side by side.

Usage

```
compareDistributions(
  left,
  right,
  add.spread = TRUE,
  print.stats = TRUE,
  xlim = NULL,
  ylim = NULL,
  clrs = c("purple", "lightblue"),
  xlab = "density",
  ylab = "value",
  ...
)
```

Arguments

left	numeric vector.
right	numeric vector.
add.spread	logical, whether to plot the spread (q25 to q75 and the median).
print.stats	logical, whether to print summary statistics for each distribution.
xlim, ylim	numeric axis limits, see lattice::xyplot().
clrs	A character vector of length 2 specifying the colors for the filled density regions.
xlab, ylab	character axis labels, see graphics::plot().
...	Additional arguments passed to stats::density().

Value

A trellis object.

Author(s)

Tim Appelhans

Examples

```
compareDistributions(rnorm(1000, 2, 3), rnorm(1000, -5, 1))
compareDistributions(rnorm(1000, 2, 3), rnorm(1000, -5, 1),
                     add.spread = FALSE)
compareDistributions(rnorm(1000, 2, 3), rnorm(1000, -5, 1),
                     add.spread = TRUE, clrs = c("red", "brown"))
compareDistributions(rnorm(1000, 2, 5), rnorm(1000, -5, 4),
                     print.stats = FALSE, add.spread = FALSE)

## pass additional parameters to density()
compareDistributions(rnorm(1000, 2, 5), rnorm(1000, -5, 4),
                     print.stats = FALSE, add.spread = FALSE, bw = 5)
compareDistributions(rnorm(1000, 2, 5), rnorm(1000, -5, 4),
                     print.stats = FALSE, add.spread = FALSE, bw = 8,
                     kernel = "rectangular")
compareDistributions(rnorm(1000, 2, 5), rnorm(1000, -5, 4),
                     print.stats = FALSE, add.spread = TRUE, bw = 8,
                     n = 3)
compareDistributions(rnorm(1000, 2, 5), rnorm(1000, -5, 4),
                     print.stats = TRUE, add.spread = TRUE, bw = 0.1)
compareDistributions(rnorm(1000, 2, 5), rnorm(1000, -5, 4),
                     print.stats = TRUE, add.spread = TRUE, bw = 0.5)
```

coords2Lines *Convert Points to* SpatialLines*

Description

Create a SpatialLines* object from a Line object or set of point coordinates in one go, i.e. without being required to run through the single steps outlined in sp::SpatialLines().

Usage

```
## S4 method for signature 'matrix'
coords2Lines(coords, ID, data, match.ID = TRUE, ...)

## S4 method for signature 'Line'
coords2Lines(coords, ID, data, match.ID = TRUE, ...)
```

Arguments

coords	Line object or 2-column numeric matrix with x and y coordinates.
ID	character, see sp::Lines().
data	data.frame with data to add to the output SpatialLines* object (optional).
match.ID	logical, see sp::SpatialLinesDataFrame().
...	Further arguments passed on to sp::SpatialLines(), i.e. proj4string.

Value

If 'data' is missing, a SpatialLines object; else a SpatialLinesDataFrame object.

Examples

```
library(sp)

coords1 <- cbind(c(2, 4, 4, 1, 2), c(2, 3, 5, 4, 2))
sln1 <- coords2Lines(coords1, ID = "A")

coords2 <- cbind(c(5, 4, 2, 5), c(2, 3, 2, 2))
sln2 <- coords2Lines(coords2, ID = "B")

plot(sln1, col = "grey75")
plot(sln2, col = "grey25", add = TRUE)
```

coords2Polygons *Convert Points to* SpatialPolygons*

Description

Create a SpatialPolygons* object from a Polygon object or set of point coordinates in one go, i.e. without being required to run through the single steps outlined in sp::SpatialPolygons().

Usage

```
## S4 method for signature 'matrix'
coords2Polygons(coords, hole = NA, ID, data, match.ID = TRUE, ...)

## S4 method for signature 'Polygon'
coords2Polygons(coords, ID, data, match.ID = TRUE, ...)
```

Arguments

coords	Polygon object or 2-column numeric matrix with x and y coordinates.
hole	logical, see sp::Polygon().
ID	character, see sp::Polygons().
data	data.frame with data to add to the output SpatialPolygons* object (optional).
match.ID	logical, see sp::SpatialPolygonsDataFrame().
...	Further arguments passed on to sp::SpatialPolygons(), i.e. p0 and proj4string.

Value

If 'data' is missing, a SpatialPolygons object; else a SpatialPolygonsDataFrame object.

Examples

```
library(sp)

coords1 <- cbind(c(2, 4, 4, 1, 2), c(2, 3, 5, 4, 2))
spy1 <- coords2Polygons(coords1, ID = "A")

coords2 <- cbind(c(5, 4, 2, 5), c(2, 3, 2, 2))
spy2 <- coords2Polygons(coords2, ID = "B")

plot(spy1, col = "grey75")
plot(spy2, col = "grey25", add = TRUE)
```

`evalMetrics` *Compute Selected Evaluation Metrics*

Description

Compute selected evaluation metrics for binary (i.e. two-class) confusion matrices.

Usage

```
evalMetrics(mat, type = c("accuracy", "precision", "recall"))
```

Arguments

`mat`	Binary confusion `matrix` (2-by-2; see Examples).
`type`	Target evaluation metric as `character`, defaults to `"accuracy"`. Other available options are `"precision"` and `"recall"`.

Value

A single `numeric`.

Author(s)

Florian Detsch

References

University of Michigan (2017) Applied Machine Learning in Python. Available online: https://www.coursera.org/learn/python-machine-learning/home/welcome.

Examples

```
in1 = matrix(c(96, 4, 8, 19), nc = 2L, byrow = TRUE)
rownames(in1) = c("Condition Positive", "Condition Negative")
colnames(in1) = c("Predicted Positive", "Predicted Negative")

evalMetrics(in1) # default: "accuracy"
evalMetrics(in1, "precision")
evalMetrics(in1, "recall")

in2 = matrix(c(26, 17, 7, 400), nc = 2, byrow = TRUE)
evalMetrics(in2, "precision")
evalMetrics(in2, "recall")
```

ext2spy *Convert Spatial Extent to Polygon*

Description

Convert a spatial extent to polygons.

Usage

```
ext2spy(x, crs = "+init=epsg:4326", as_sf = TRUE)
```

Arguments

x	An Extent object, or any object from which an Extent can be extracted, e.g. Raster*.
crs	Coordinate reference system passed to sp::proj4string().
as_sf	logical. If TRUE (default), the returned object is of class sf rather than Spatial*.

Value

Depending on 'as_sf', either a sf or SpatialPolygons object.

Author(s)

Florian Detsch

See Also

raster::extent().

Examples

```
ext = extent(c(25, 70, -5, 30))
ext2spy(ext) # 'sf' (default)
ext2spy(ext, as_sf = FALSE) # 'Spatial*'
```

`ifMissing` *Take Measures in Case of Nonexisting Target Files*

Description

If a target file already exists, it is simply being imported into R. However, if the specified target file does not exist, it is first created by a user-defined function and subsequently returned, thus rendering explicit calls to `file.exists()` unnecessary.

Usage

```
ifMissing(ofl, fun0 = raster::brick, fun1 = raster::writeRaster, arg1, ...)
```

Arguments

`ofl`	Target file name as `character`.
`fun0`	If 'ofl' exists, `function` to be applied to it. Defaults to `raster::brick()`).
`fun1`	If 'ofl' does not exist, `function` used to create it. Defaults to `raster::writeRaster()`).
`arg1`	Argument in 'fun1' (as `character`) that corresponds to 'ofl', e.g. 'filename' in `raster::writeRaster()` or 'file' in `utils::write.table()`. If missing (default), the target file name passed to 'fun1' needs to be explicitly included via '...'.
`...`	Additional arguments passed to 'fun0' and 'fun1'.

Value

If 'ofl' has already existed, the contents of 'ofl' derived from 'fun0'; else the output resultant from 'fun1'.

Author(s)

Florian Detsch

See Also

`file.exists()`, `do.call()`.

Examples

```
# simply import existing file
logo <- system.file("external/rlogo.grd", package = "raster")
s <- ifMissing(logo)

# create nonexisting file and import it afterwards
logo2 <- file.path(tempdir(), "rlogo.tif")
s2 <- ifMissing(logo2, arg1 = "filename", x = s, datatype = "INT1U")
```

```
# this also works with text files and more sophisticated custom functions
fun = function(x, file = "", ...) {
  write.csv(x, file, ...)
  read.csv(file)
}

data(iris)
ofl <- file.path(tempdir(), "iris.csv")
iris2 <- ifMissing(ofl, fun1 = fun, x = iris, file = ofl, quote = FALSE, row.names = FALSE)
```

KiLi *Bing Aerial Image of Kilimanjaro*

Description

Bing aerial image of Kilimanjaro downloaded from OpenStreetMap.

Format

A "RasterStack-class" with 3 bands (red, green, blue).

Details

Copyright: OpenStreetMap contributors, see https://www.openstreetmap.org/copyright.

---

latticeCombineGrid *Combine Multiple Lattice Plots in a Faceted Grid (Panels)*

Description

This function combines multiple **lattice** plot objects in a faceted grid. Note that the global plot settings (e.g. 'xlim', 'ylim', ...) are taken from the first object though the user can specify whether 'scales' should be identical or not. This is particularly useful when looping over large amounts of data using lapply() (see Examples).

Usage

```
latticeCombineGrid(
  trellis.list,
  between = list(y = 0.3, x = 0.3),
  as.table = TRUE,
  ...
)
```

Arguments

trellis.list	A list containing **lattice** plot objects.
between	Space between panels.
as.table	If TRUE (default), drawing is top left to bottom right.
...	Additional arguments passed to latticeExtra::c.trellis().

Value

A single **lattice** plot object.

Author(s)

Tim Appelhans

See Also

latticeExtra::c.trellis().

Examples

```
#load data
#Use a probability map assuming high potential for city expansion is just
#resulting from proximity to current urban area:
pred <- raster(system.file("extdata/probability.rst", package = "Orcs"))

#observed city growth between 1990 and 2006
obs <- raster(system.file("extdata/citygrowth.tif", package = "Orcs"))

#masking current urban area since these pixels have no potential for change
mask <- raster(system.file("extdata/citymask.tif", package = "Orcs"))

#create data list
dat <- list(pred, obs, mask)

#create list of lattice plots
plist <- lapply(seq(dat), function(i) {
  spplot(dat[[i]], scales = list(draw = TRUE))
})

#draw individually
plist[[1]]
plist[[2]]
plist[[3]]

#combine to grid, using c(1, 3) layout
p <- latticeCombineGrid(plist, layout = c(1, 3))
print(p)
```

`latticeCombineLayer` *Combine Multiple Lattice Plots Layerwise*

Description

This function combines multiple **lattice** plot objects drawing each as a layer on top of the previous plots. Note that the global plot settings (e.g. 'xlim', 'ylim', ...) are taken from the first object. This is particularly useful when looping over large amounts of data using `lapply()` (see Examples).

Usage

```
latticeCombineLayer(trellis.list, ...)
```

Arguments

`trellis.list`	A `list` containing **lattice** plot objects.
`...`	Additional arguments passed to `latticeExtra::as.layer()`.

Value

A single **lattice** plot object.

Author(s)

Tim Appelhans

See Also

`latticeExtra::as.layer()`.

Examples

```
library(latticeExtra)
dat <- list(1:10,
            10:1,
            3:7,
            7:3)

plist <- lapply(seq(dat), function(i) {
 tmp <- xyplot(dat[[i]] ~ seq(dat[[i]]),
               type = "l", col = i)
})

p <- latticeCombineLayer(plist)

print(p)
```

lineEnding *Convert Between DOS and UNIX Line Endings*

Description

This function converts between DOS and UNIX style line endings by invoking `unix2dos` (or `dos2unix`) upon a text file (see also `system("unix2dos --help")`). Note that 'unix2dos' must be installed on your local system, see Source.

Usage

```
lineEnding(infile, pattern = NULL, outfile = NULL, to = c("dos", "unix"), ...)
```

Arguments

`infile`	Input filename(s).
`pattern`	See `list.files()`. This will be ignored if 'infile' is specified.
`outfile`	Output filename. If not supplied, 'infile' will be overwritten.
`to`	Either `"dos"` or `"unix"`.
`...`	Additional arguments passed to `list.files()`, only applicable if 'infile' is not specified.

Author(s)

Florian Detsch

Source

Dos2Unix/Unix2Dos Text file format converters.

See Also

`list.files()`, `system()`.

Examples

```
## input file
infile <- paste(system.file(package = "Orcs"), "DESCRIPTION", sep = "/")

## convert to dos line endings and write to output file
ofl = file.path(tempdir(), "DESCRIPTION4wd")
lineEnding(infile, outfile = ofl, to = "dos")
```

list2df *Create* data.frame *from* list

Description

Create a data.frame from a list directly, i.e. without being required to explicitly call rbind() first.

Usage

```
list2df(x, bind = c("rows", "cols"), ...)
```

Arguments

x	A list object.
bind	Binding direction. Available options are "rows" (default) and "cols" for rbind() and cbind(), respectively.
...	Additional arguments passed to data.frame().

Value

A data.frame object.

Examples

```
lst <- list(letters[1:3], letters[4:6], letters[7:9])

do.call("rbind", lst) # results in matrix
list2df(lst)          # results in data.frame created using rbind()
list2df(lst, bind = "cols") # same for cbind()
```

loadFromGit *Install and Load a Package from GitHub*

Description

This function comprises multiple steps required to install and load a package directly from GitHub.

Usage

```
loadFromGit(repo = "fdetsch/Orcs", ...)
```

Arguments

repo	Repository address as character, defaults to "fdetsch/Orcs".
...	Additional arguments passed to remotes::install_github().

Author(s)

Florian Detsch

Examples

```
## Not run:
## install 'Orcs' from GitHub
loadFromGit("fdetsch/Orcs")

## End(Not run)
```

---

loadPkgs *Load Multiple Packages*

Description

Load and attach multiple packages at once.

Usage

```
loadPkgs(pkgs, ...)
```

Arguments

pkgs	Packages to load as character.
...	Additional arguments passed to library(), except for 'character.only' which is set to TRUE.

Note

Package start-up messages are automatically disabled.

Author(s)

Florian Detsch

Examples

```
loadPkgs(c("raster", "rgdal"))
```

`meanDifference` *Calculate Mean Difference Between Two Datasets*

Description

Calculate the mean difference between two datasets as suggested by Wang *et al.* (2012).

Usage

```
## S4 method for signature 'RasterLayer'
meanDifference(x, y)

## S4 method for signature 'numeric'
meanDifference(x, y)
```

Arguments

`x, y`	Objects of class `RasterLayer` or `numeric`.

Value

The mean difference between the two inputs either as `RasterLayer` or `numeric`.

Source

Wang *et al.* (2012) Impact of sensor degradation on the MODIS NDVI time series. Remote Sensing of Environment 119, 55-61, doi:10.1016/j.rse.2011.12.001.

Detsch *et al.* (2016) A Comparative Study of Cross-Product NDVI Dynamics in the Kilimanjaro Region - A Matter of Sensor, Degradation Calibration, and Significance. Remote Sensing 8(2), 159, doi:10.3390/rs8020159.

Examples

```
x <- 1:10
y <- 2:11
meanDifference(x, y)
```

merge *Merge Objects Stored in a List*

Description

Complementing existing merge methods, e.g. `raster::merge()` for `Raster*` objects, which typically work with one or two inputs only, this function accepts a `list` of objects that are to be merged together.

Usage

```
## S4 method for signature 'list,missing'
merge(x, by = 1L, all = TRUE, ...)
```

Arguments

`x`	A `list` of objects of the same type (e.g. `Raster*` or `data.frame`).
`by, all`	See `merge.data.frame()`. Ignored if data stored in 'x' is not of class `data.frame`.
`...`	Additional arguments passed to the underlying merge method (e.g. arguments compatible with `raster::merge()` and `raster::writeRaster()` for `Raster*` input). Ignored if data stored in 'x' is of class `data.frame`.

Value

A merged object (e.g. a new `Raster*` object with a larger spatial extent).

Author(s)

Florian Detsch

See Also

`do.call()`, `Reduce()`.

Examples

```
## Raster* input
dms = list.files(system.file("extdata", package = "Orcs")
                 , pattern = "ASTGTM2.*dem.tif$", full.names = TRUE)
dms = lapply(dms, raster)

dem = merge(dms, tolerance = 1e4)
plot(dem)

## data.frame input
mrg = merge(list(iris, iris, iris)
            , by = c("Species", "Sepal.Length", "Petal.Width"))
head(mrg)
```

multiKnit *Convert Multiple R Markdown Files to Ordinary Markdown*

Description

This function is a convenient wrapper around `knitr::knit()` as it automatically converts multiple R Markdown files (`.Rmd`) located in a specified folder (and, optionally, matching a particular pattern) to standard Markdown (`.md`).

Usage

```
multiKnit(path_in = ".", path_out = path_in, pattern = "*.Rmd$", ...)
```

Arguments

`path_in`	Input file path as `character`, defaults to the current working directory.
`path_out`	Output file path as `character`, defaults to 'path_in'.
`pattern`	Passed to `list.files()`, defaults to `"*.Rmd$"`.
`...`	Additional arguments passed to `knitr::knit()`.

Value

Output filenames as `character`.

Author(s)

Florian Detsch

offsetGridText *Insert Offset Text Annotation into* `trellis` *Plot*

Description

This is a wrapper function around `Orcs:::calcOffsetGridText` and **grid** based text drawing functions (currently including `grid::grid.text()` and `grid.stext()`) that automatically adds offset text annotations to a `trellis` plot.

Usage

```
offsetGridText(
  x,
  y = NULL,
  labels,
  xlim = NULL,
  ylim = NULL,
  pos = NULL,
  stext = FALSE,
  offset = 0.02,
  ...
)
```

Arguments

x	A numeric vector containing x coordinates, or a 2-column matrix containing x and y coordinates.
y	A numeric vector containing y coordinates, or NULL if 'x' is a two-column matrix.
labels	The text to be written as character.
xlim, ylim	X and Y-axis limits (c(min, max)) of the current plot. If not supplied, limits are automatically calculated from supplied x and y coordinates.
pos	Text position specifier(s) as integer used by graphics::text(). If not supplied, optimal text positions will be determined with respect to neighboring locations using plotrix::thigmophobe().
stext	logical, defaults to FALSE. If TRUE, shadow text will be drawn around 'labels'.
offset	A numeric offset in normalized parent coordinates ("npc", see grid::unit()).
...	Additional arguments passed to the respective **grid** text drawing function (depends on 'stext').

Author(s)

Florian Detsch

Examples

```
stopifnot(
  require(sf)
  , require(latticeExtra)
  , require(grid)
)

# kilimanjaro peaks
peaks = data.frame(Peak = c("Kibo", "Mawenzi", "Shira")
                   , Lon = c(37.359031, 37.455061, 37.210408)
                   , Lat = c(-3.065053, -3.095436, -3.038222))
```

```
coordinates(peaks) = ~ Lon + Lat
proj4string(peaks) = "+init=epsg:4326"

# visualization
xlim_kili <- c(37.15, 37.55)
ylim_kili <- c(-3.25, -2.9)

p = spplot(KiLi[[1]], col.regions = "transparent", colorkey = FALSE,
           xlim = xlim_kili, ylim = ylim_kili,
           scales = list(draw = TRUE, y = list(rot = 90)),
           sp.layout = rgb2spLayout(KiLi, quantiles = c(0, 1), alpha = .8)) +
  layer(sp.points(peaks, cex = 1.5, pch = 20, col = "black"))

print(p)

downViewport(trellis.vpname(name = "figure"))
offsetGridText(x = coordinates(peaks), labels = peaks$Peak,
               xlim = xlim_kili, ylim = ylim_kili, stext = TRUE, offset = .02,
               gp = gpar(fontsize = 16))
```

`OrcsCppFun` *Dimensions of a* `data.frame`

Description

Similar to base-R `nrow()`, `ncol()` and `dim()`, this set of functions let's you retrieve the number of rows and columns of a `data.frame`.

Usage

```
nrowC(x)

ncolC(x)

dimC(x)
```

Arguments

`x`	A `data.frame`.

Value

`dimC()` returns an `integer` vector of length 2 (number of rows and columns); `nrowC()` (or `ncolC()`) returns the number of rows (or columns) as a single `integer`.

Functions

- `nrowC()`:
- `ncolC()`:
- `dimC()`:

Author(s)

Florian Detsch

Examples

```
dat <- data.frame(a = 1:4, b = 2:5, c = 3:6)

nrowC(dat)
```

---

par7zip *Parallelized 7-Zip Compression*

Description

By calling the Unix terminal or Windows command prompt, this function performs parallelized 7-zip compression of selected files based on the built-in **parallel** package.

Usage

```
par7zip(outfile, nodes = 1L, ...)
```

Arguments

`outfile`	Target file for compression as `character`. A file extension compatible with 7-zip needs to be included, see supported formats. If missing, this defaults to the found input file names with a `.7z` extension attached.
`nodes`	Number of cores to use for parallelization as `integer`, defaults to `1L`.
`...`	Additional arguments passed to `list.files()`.

Value

Output filename(s) as `character`.

Author(s)

Florian Detsch

See Also

`list.files()`, `system()`

pureBasename *Return File Name without Extension*

Description

As opposed to basename(), this function returns the pure basename of one or multiple file names, i.e. without extension.

Usage

```
pureBasename(path, slash = FALSE)
```

Arguments

path	File name(s) as character.
slash	A logical determining whether to add a leading slash ("/") to the returned file name.

Value

File name(s) without extension as character.

Author(s)

Florian Detsch

See Also

tools::file_path_sans_ext().

Examples

```
fls <- system.file("external/rlogo.grd", package = "raster")
pureBasename(fls)
pureBasename(fls, slash = TRUE)
```

pvalue *Get* p*-Value from 'lm' Object*

Description

Retrieve the *p*-value associated with a univariate linear regression.

Usage

```
pvalue(mod)
```

Arguments

mod	An object of class `lm`.

Value

A `numeric` *p*-value.

Source

retrieving p-values in lm on R-help mailing list.

See Also

`stats::lm()`.

Examples

```
## taken from ?lm
ctl <- c(4.17,5.58,5.18,6.11,4.50,4.61,5.17,4.53,5.33,5.14)
trt <- c(4.81,4.17,4.41,3.59,5.87,3.83,6.03,4.89,4.32,4.69)
group <- gl(2, 10, 20, labels = c("Ctl","Trt"))
weight <- c(ctl, trt)
lm.D9 <- lm(weight ~ group)

pvalue(lm.D9)
```

rgb2spLayout *Convert an RGB* Raster* *to Use with* spplot()

Description

This function takes a red-green-blue Raster* object and produces a list with color information that can be passed on to the 'sp.layout' argument from sp::spplot().

Usage

```
rgb2spLayout(x, quantiles = c(0.02, 0.98), alpha = 1)
```

Arguments

x	A 3-layered Raster* object.
quantiles	Upper and lower quantiles used for color stretching.
alpha	Level of transparency.

Author(s)

Tim Appelhans, Florian Detsch

See Also

raster::plotRGB().

Examples

```
library(raster)
library(sp)

b <- brick(system.file("external/rlogo.grd", package="raster"))

## using plotRGB
plotRGB(b)

## convert brick to list
lout <- rgb2spLayout(b)
lout_alph <- rgb2spLayout(b, alpha = 0.5)

## create random spatial points for plotting
df <- data.frame(dat = rnorm(100, 2, 1),
                 x = rnorm(100, 50, 20),
                 y = rnorm(100, 50, 25))
coordinates(df) <- ~x+y

## plot spatial points with rgb background
spplot(df, sp.layout = lout)
spplot(df, sp.layout = lout_alph)
```

rmDuplCols *Remove Duplicated Columns from* data.frame

Description

Automatically detect and remove columns from a data.frame based on duplicated headers.

Usage

```
rmDuplCols(x, keep_first = TRUE, ...)
```

Arguments

x	Input data.frame.
keep_first	A logical determining whether the first column of an otherwise duplicated header should be kept, defaults to TRUE.
...	Currently not in use.

Value

Revised data.frame.

Author(s)

Florian Detsch

See Also

duplicated().

Examples

```
## sample data
set.seed(123)
dat <- data.frame(matrix(rnorm(28), nc = 7))
names(dat) <- c("Col1", "Col1", "Col1", "Col2", "Col3", "Col3", "Col4")

dat
rmDuplCols(dat)
rmDuplCols(dat, keep_first = FALSE)
```

setwdOS *Set Working Directory Dependent on Current OS*

Description

Similar to setwd(), this function sets the working directory to a user-defined path. Rather than supplying a single 'dir' argument, however, both an OS-sensitive path to the desired hard disk partition and, optionally, an extension of this file path are required.

Usage

```
setwdOS(lin = "/media/permanent/", win = "C:/", ext = NULL)
```

Arguments

lin, win	Absolute file paths to the Linux and Windows partition as character.
ext	Optional file path extension as character that will be added to 'lin' or 'win' after automatic OS determination.

Author(s)

Florian Detsch

See Also

switch().

Examples

```
## Not run:
# desired partition
setwdOS()

# including file path extension
setwdOS(ext = "kilimanjaro/nubiscope")

## End(Not run)
```

stextGrob *Draw Shadow Text*

Description

Create and draw shadow text by wrapping a textual expression into a colored framing.

Usage

```
stextGrob(
  label,
  x = grid::unit(0.5, "npc"),
  y = grid::unit(0.5, "npc"),
  col = "white",
  fill = "black",
  r = 0.1,
  gp = grid::gpar(),
  vp = NULL,
  name = NULL,
  ...
)
```

Arguments

label	A character or expression vector, see grid::textGrob().
x, y	Horizontal and vertical text position as grid::unit() objects passed to grid::grid.text().
col, fill	Framing and fill color passed to grid::gpar().
r	Blur radius of colored framing as numeric.
name, gp, vp	Graphical parameters passed to grid::gTree().
...	Additional arguments passed to [grid::grid.text()].

Value

A text grob created by grid::gTree().

Author(s)

Baptiste Auguie, Florian Detsch

Examples

```
library(grid)
grid.newpage()
grid.rect(gp = gpar(fill = "grey"))
grid.stext("test")
```

substrC *Substrings of a Character Vector (C++ Style)*

Description

Extract substrings from a `character` vector in C++.

Usage

```
substrC(x, pos, len)
```

Arguments

`x`	A `character` vector.
`pos`	The start point of the substring as `integer`. Position indications start from `1L`, which is the default in R.
`len`	The length of the substring as `integer`.

Value

A `character` vector of the same length as 'x'.

See Also

https://cplusplus.com/reference/string/string/substr/, `substr()`.

Examples

```
substrC("Hello, world!", pos = 1, len = 5)
```

trimImages *Remove Whitespace from Images*

Description

This is a wrapper function around `convert -trim` to automatically remove any whitespace from locally saved images. Note that 'ImageMagick' must be installed on your local system, see Source.

Usage

```
trimImages(path = ".", pattern = c(".png$", ".tiff$"))
```

Arguments

path	File path leading to image files as character, defaults to the current working directory.
pattern	A regular expression as character accepted by list.files(), defaults to c(".png$", ".tiff$").

Value

A character vector containing the names of the processed images.

Author(s)

Florian Detsch

Source

See Also

system()

Examples

```
## Not run:
## trim image of bart simpson
download.file("http://pngimg.com/uploads/simpsons/simpsons_PNG93.png?i=1"
              , destfile = (ofl <- file.path(tempdir(), "bart.png", fsep = "\\"))
              , mode = "wb")

par(mfrow = c(1, 2))

img = brick(ofl)
plotRGB(img)

jnk = trimImages(tempdir(), "bart.png")
trm = brick(jnk)
plotRGB(trm)

dev.off()

## End(Not run)
```

unlistStrsplit *Unlist the Outcome of* strsplit()

Description

Per default, strsplit() returns a list, with each entry holding the vector of splits of the initial string(s). This function is a simple wrapper that casts unlist() upon the returned list to produce a concatenated character vector consisting of the single split elements.

Usage

```
unlistStrsplit(x, split, ...)
```

Arguments

x	A character vector with elements to be split.
split	A character vector used for splitting, see strsplit().
...	Additional arguments passed to strsplit().

Author(s)

Florian Detsch

Examples

```
## 1st example
x <- "This is a test."
unlistStrsplit(x, " ")

## 2nd example; note that 'split' defaults to 'whitespace'
x2 <- "This is a 2nd test."
unlistStrsplit(c(x, x2))
```

unsortedFactor *Factor with Unsorted Levels*

Description

Casting factor() upon a (character) vector usually results in alphabetically ordered factor levels. Although this seems reasonable in most cases, the automated ordering of factor levels is seldomly desirable in the context of visualization, e.g. when working with tiled **lattice** or **ggplot2** figures. This function returns a factor with levels ordered according to their first appearance in the supplied vector.

Usage

```
unsortedFactor(x, ...)
```

Arguments

x	A character vector with elements to converted to factor.
...	Additional arguments passed to factor().

Author(s)

Florian Detsch

Examples

```
mnth <- month.abb

## factor levels are being sorted
fc_mnth <- factor(mnth)
levels(fc_mnth)

## factor levels remain unsorted
fc_mnth2 <- unsortedFactor(mnth)
levels(fc_mnth2)
```
